## **1 Summary**

This report provides information on the 2017 energy consumption and greenhouse gas (GHG) emissions for 1,482 City of Toronto buildings and sites. This information has been provided to the Ontario Ministry of Energy as required by the *Ontario Green Energy Act (GEA)*, Regulation 397/11.

The City of Toronto collects utility data and stores the information using an energy management system. The energy management team in the City's Environment and Energy Division uses this system to monitor energy bills, analyze the corresponding data, and verify savings from energy retrofits. This system was used as the primary source of the 2017 energy data.

In addition to the mandated operation types required by the Green Energy Act, several additional operation types have been included in this report (see Appendix 'B'). The City has chosen to exceed minimum reporting requirements based on the fact that these additional operations contribute significantly to the energy consumption and GHG emissions within the City of Toronto. Some locations have not been included, as the Environment and Energy Division is not tasked with the tracking and monitoring of energy data for these locations.

The report distinguishes between energy used to operate City buildings, and energy used to operate industrial-type processes, such as Toronto Water's treatment and pumping facilities, Toronto Transit Commission operations, as well as energy used outdoors for street and other public space lighting.

The Green Energy Act's Regulation 397/11 also mandates the completion of an Energy Conservation and Demand Management (ECDM) Plan every 5 years. The City of Toronto completed the first edition of this plan, which was approved by Council, in 2014. Facilities have been prioritized for energy retrofit work based on their energy savings and GHG reduction potential. The City aims to build on its previous energy efficiency achievements through the use of the ECDM plan as a framework for the identification, implementation and verification of future energy saving projects.

## **2 Background**

In 2009, the Ontario legislature passed the Green Energy and Green Economy Act (GEA). As one of its objectives, the GEA aims to increase energy conservation by introducing measures to help Ontarians manage energy use. The GEA's Regulation 397/11, published in August 2012, requires all public agencies to prepare and publish:

1. Annually updated reports on the energy consumption and greenhouse gas (GHG) emissions for City's facilities.
2. A report outlining plans for further identification and implementation of ECDM projects throughout City facilities. The first report was released in July 2014 and will be updated every five years thereafter.

## **3 Synergies with Existing Mandates**

The creation and implementation of this report and the ECDM plan are within the context of the City's energy and environmental mandates based on:

1. TransformTO: Climate Action for a Healthy, Equitable and Prosperous Toronto - Report 2 - The Pathway to a Low Carbon Future, adopted by City Council in July 2017, which recognizes the key leadership role City facilities will need to play in demonstrating the potential for net-zero new construction, and deep-carbon reduction through retrofitting existing buildings.
2. Energy conservation and generation measures contained in "The Power to Live Green: Toronto's Sustainable Energy Strategy", adopted by City Council in November 2009. This strategy features a series of recommendations and measures to achieve higher energy efficiencies within City facilities.
3. Recommendations in the "Climate Change, Clean Air and Sustainable Energy Action Plan" regarding City-owned facilities, adopted by City Council in July 2007.

## **4 Sources of Data, Uncertainty & Constraints**

The Energy & Waste Management Office, within the Environment & Energy Division at the City of Toronto, is responsible for gathering energy and water consumption data from various utility providers for a multitude of facilities within the City's service agencies and divisions. This data is used for populating the City's energy management database and the information contained in this report. Based on the current reporting requirements by Regulation 397/11, the consumption data in this report contains information on building specific energy consumption.

Energy billing data used in this report is comprised of digital files received from the utility companies, consolidated billing files from a third-party, and paper bills. Although every effort is made to audit all bill entries, with several thousand utility bills submitted each month there is a small potential for data entry errors. The City continues to work with our utility providers to further improve data accuracy and is working on plans for automated data acquisition where possible.

Specific building design and operations need to be taken into account when examining the results in this report. For example, low energy intensities do not always imply good efficiency. Examples of such cases are old buildings with limited ventilation, vacant buildings or those with malfunctioning heating, ventilation, and cooling equipment. Some facilities, such as childcare centers and smaller administrative offices can be located in shared building spaces resulting in potential sources of error in corresponding energy consumption data.

### ***4.1 Building vs Process Energy***

The City of Toronto manages a vast portfolio of buildings, including office buildings, community centres, and libraries. These building types use energy for interior lighting, heating and cooling, and for providing services, like pools and arenas, to the public. The City also manages several assets that use process energy. Process energy is used in operations such as, traffic signals, water treatment, and park lighting. The energy use in these operation types is driven by processes related to infrastructure throughout the City. For the purpose of this report, building and process energy are separated to be able to accurately reflect energy use within the City.

## **4.2 Sources of Greenhouse Gas Emissions**

Greenhouse gas emissions are created by energy consumption in City buildings and processes. Of the four primary utilities used in City facilities, steam and natural gas have the highest greenhouse gas emissions per equivalent kWh.

<b>Grams of CO<sub>2</sub> per equivalent kWh</b>					
	<b>2017</b>	<b>2016</b>	<b>2015</b>	<b>2014</b>	<b>2013</b>
<b>Electricity</b>	36.00	36.00	40.00	41.00	77.00
<b>Natural Gas</b>	179.95	179.95	179.95	179.95	179.92
<b>Steam</b>	210.01	211.43	218.55	239.22	185.16
<b>Chilled Water</b>	11.74	11.83	13.36	7.36	13.36

Emission factors for 2017 for electricity and natural gas are estimated as the factors are not available until April 2019. The elimination of coal-based electricity generation has reduced the emission factor from a high of 308 grams in 2003 to 40 grams in 2015. The existing emission factor is a result of natural gas-based electricity generation. Electricity emission factors come from the United Nations National Inventory Report, as reported by Environment Canada. Natural gas emission factors have remained steady since the fuel is burned at the building. There is no expectation that this number will be reduced in the coming years. Natural gas is the highest source of greenhouse gas emissions and should be the primary focus to achieve TransformTO objectives. Natural gas emission factors come from the United Nations National Inventory Report, as reported by Environment Canada

([http://unfccc.int/national\\_reports/annex\\_i\\_ghg\\_inventories/national\\_inventories\\_submissions/items/9492.php](http://unfccc.int/national_reports/annex_i_ghg_inventories/national_inventories_submissions/items/9492.php)).

Chilled Water emission factors are a result of the electricity used to pump water through the Enwave system. This source of cooling energy has very low emissions. Chilled water emission factors come from Enwave. Steam emission factors are driven by fuels used to create steam in the Enwave system. Natural gas, diesel oil, and gasoline are used, depending on the availability and cost of the fuels. In the past

three years, Enwave was required to supplement the use of natural gas with diesel oil and/or gasoline, which have higher emission factors, to provide customers with steam during extreme cold events. Steam emission factors come from Enwave.

#### **4.3 TransformTO Targets**

In July 2017, City Council adopted TransformTO: Climate Action for a Healthy, Equitable and Prosperous Toronto - Report 2 - The Pathway to a Low Carbon Future, which sets greenhouse gas emission targets to 30%, 65% and 80% below 1990 levels by 2020, 2030 and 2050, respectively. TransformTO lays out several strategies to achieve its emission reduction targets, including a 40% reduction in building energy use from 2017 levels. The following table details the total energy use of City buildings, by operation type, and the 2040 energy targets.

Operation Type	Total GHG (Tonnes)	Total ekWh	2040 kWh Target
Administrative Offices	12729	138,414,430	83,048,658
Police Stations	7396	79,510,991	47,706,595
Long Term Care Homes	8315	70,132,959	42,079,776
Community Centres	7440	65,736,111	39,441,666
Indoor Recreational Facilities	7655	63,291,085	37,974,651
Storage Facilities	7909	62,186,058	37,311,635
Public Libraries	5001	52,798,786	31,679,272
Transportation Hub	3931	37,584,440	22,550,664
Indoor Sports Arena	3795	36,671,460	22,002,876
Fire Stations	4287	31,516,853	18,910,112
Transfer Stations	1477	21,638,401	12,983,041
Cultural Facilities	1399	15,611,617	9,366,970
Indoor Swimming Pool	1855	13,743,123	8,245,874
Ambulance Stations	1550	13,739,695	8,243,817
Shelters & Housing	1778	13,151,034	7,890,620
Greenhouses	2127	12,918,091	7,750,854
Performing Arts Facilities	1061	10,074,922	6,044,953
Child Care Facilities	278	2,453,857	1,472,314
Animal Centres	288	2,374,119	1,424,471
Laboratory	150	1,830,428	1,098,257
<b>Grand Total</b>	<b>80421</b>	<b>745,378,459</b>	<b>447,227,075</b>

Based on analysis of existing planned and funded programs and policies, Toronto is projected to meet our 2020 target of a 30% reduction in GHG emissions from 1990 levels. Chilled water has been used to offset the energy and greenhouse gas emissions of electricity in a number of City buildings. Expansion of this type of fuel-switching can help the City reach its TransformTO goal. Steam consumption is primarily used for heat energy in place of natural gas. Natural gas is the leading cause of GHG emissions in City facilities and processes. Efforts to reduce dependency on natural gas through energy retrofits, renewable energy, and fuel-switching will have the largest impact on total City facility GHG emissions. Consumption of one cubic metre of natural gas releases the equivalent of nearly 2 kilograms of CO<sub>2</sub>.

## 5 Building Energy and Greenhouse Gas Emissions Analysis

Energy is delivered to City facilities in two forms referred to as primary and secondary energy. Primary energy is raw fuel such as natural gas or fuel oil, delivered directly to the buildings to provide services. Secondary energy is the product created from raw fuel, such as electricity purchased from the grid or the chilled water received from a district energy system. Figure 1 illustrates City of Toronto's building energy consumption by fuel type, which amounts to nearly **740 million** equivalent kWh on the reported facilities.

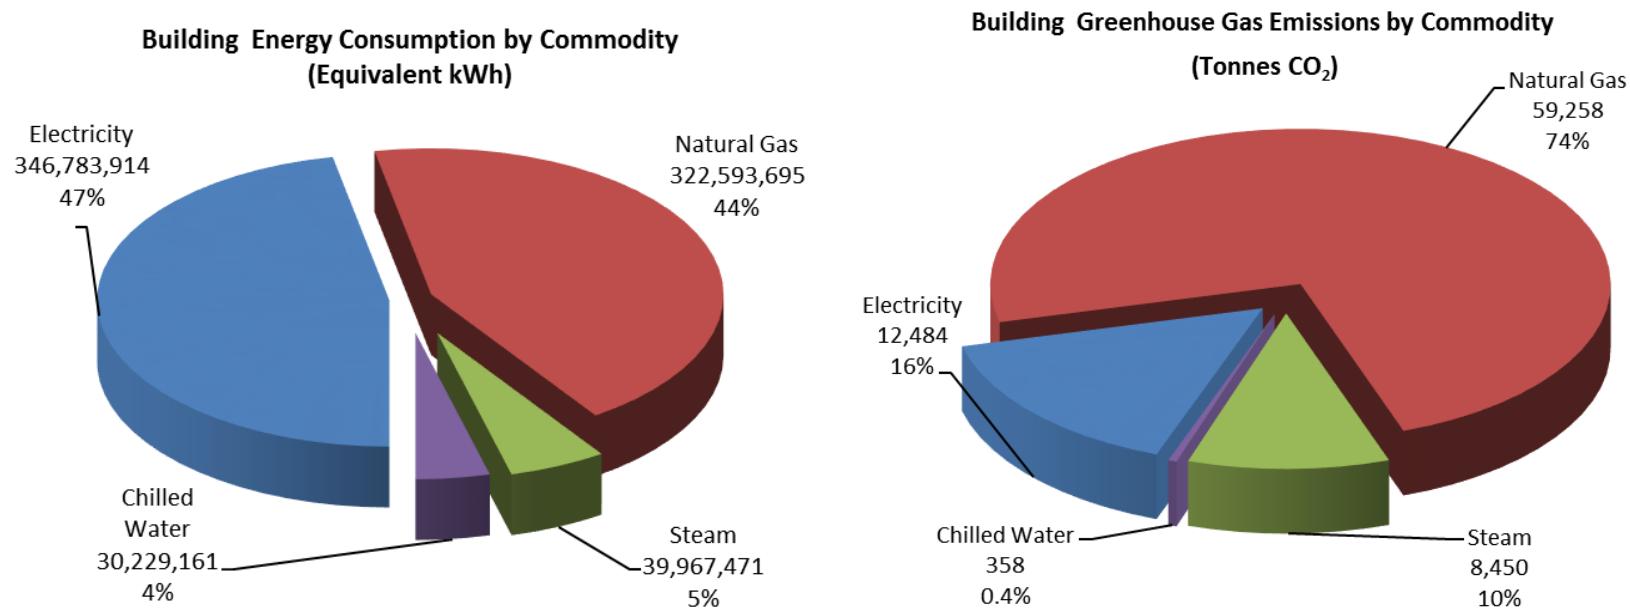

Figure 1: Building Energy Consumption and GHG Emissions by Energy Type

Of the reported facilities, electricity consumption makes up nearly half of all energy sources at **347 million** equivalent kWh or **47%** of the overall energy use. Electricity is used for lighting, ventilation, and cooling in many City buildings. Natural gas makes up more than **322 million** equivalent kWh or approximately **44%** of the reported energy use. The majority of the natural gas consumption at City facilities is used for domestic hot water and space heating needs.

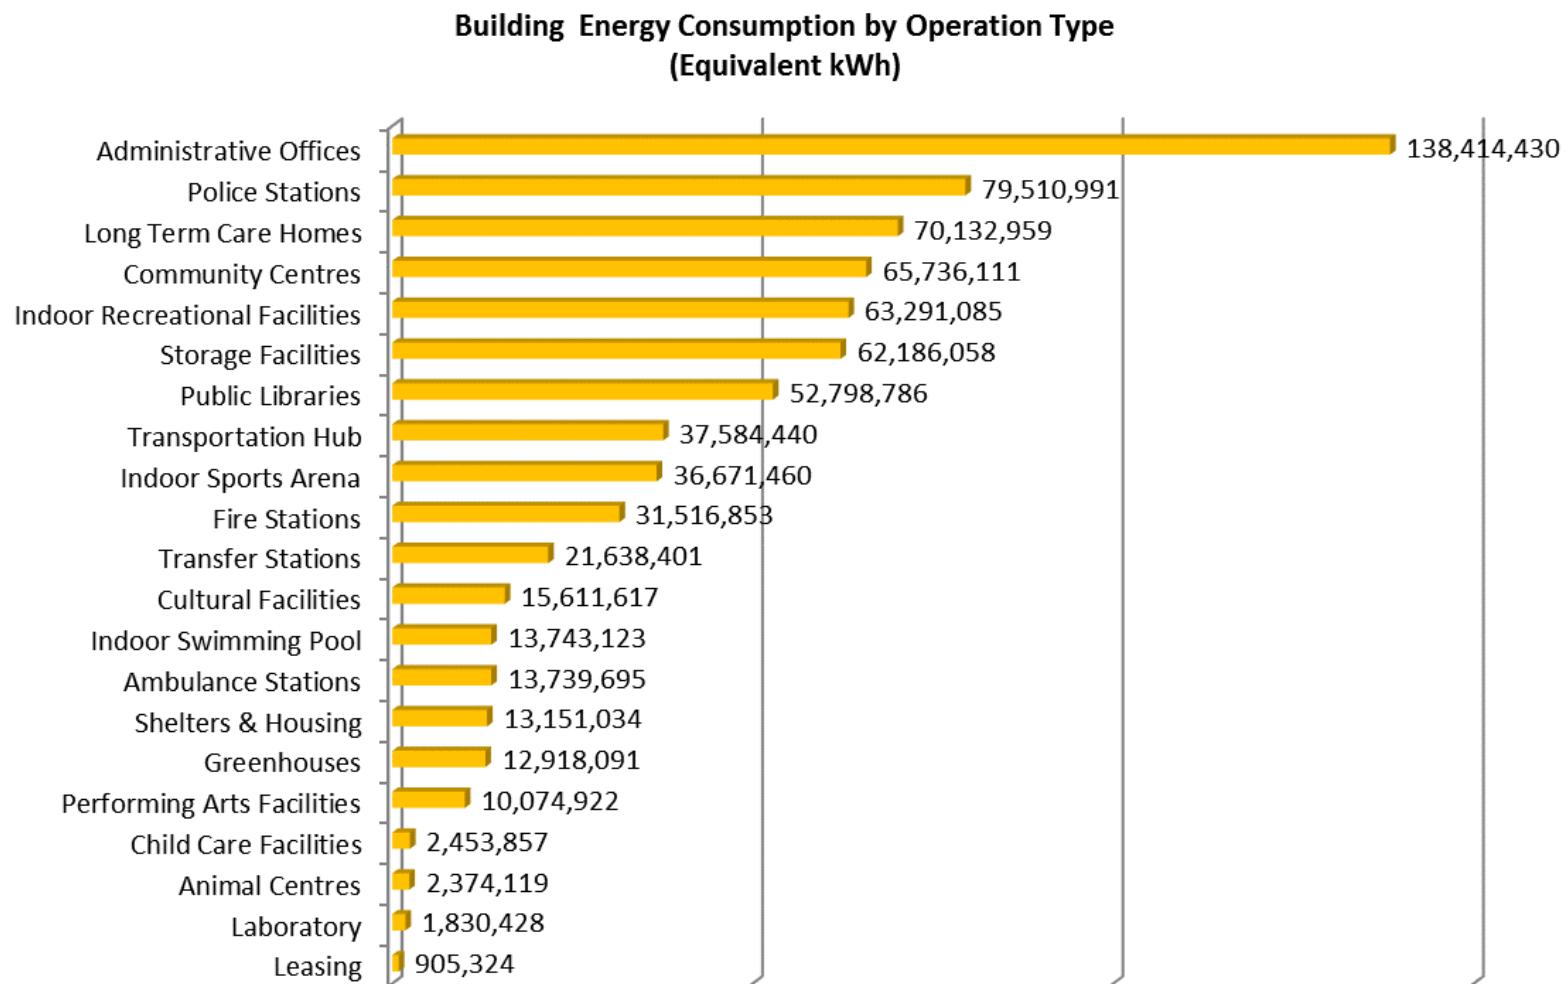

Chilled water from the Enwave district cooling system (also known as deep lake water cooling) is used for air-conditioning in some City facilities such as City Hall, Metro Hall and most recently Union Station and Old City Hall. This renewable source of energy supports efforts to reduce greenhouse gas emissions at the associated facilities. Many of the same facilities utilize steam, provided by the Enwave district heating system for space heating and domestic hot water heating.

### **5.1 Building Energy Consumption**

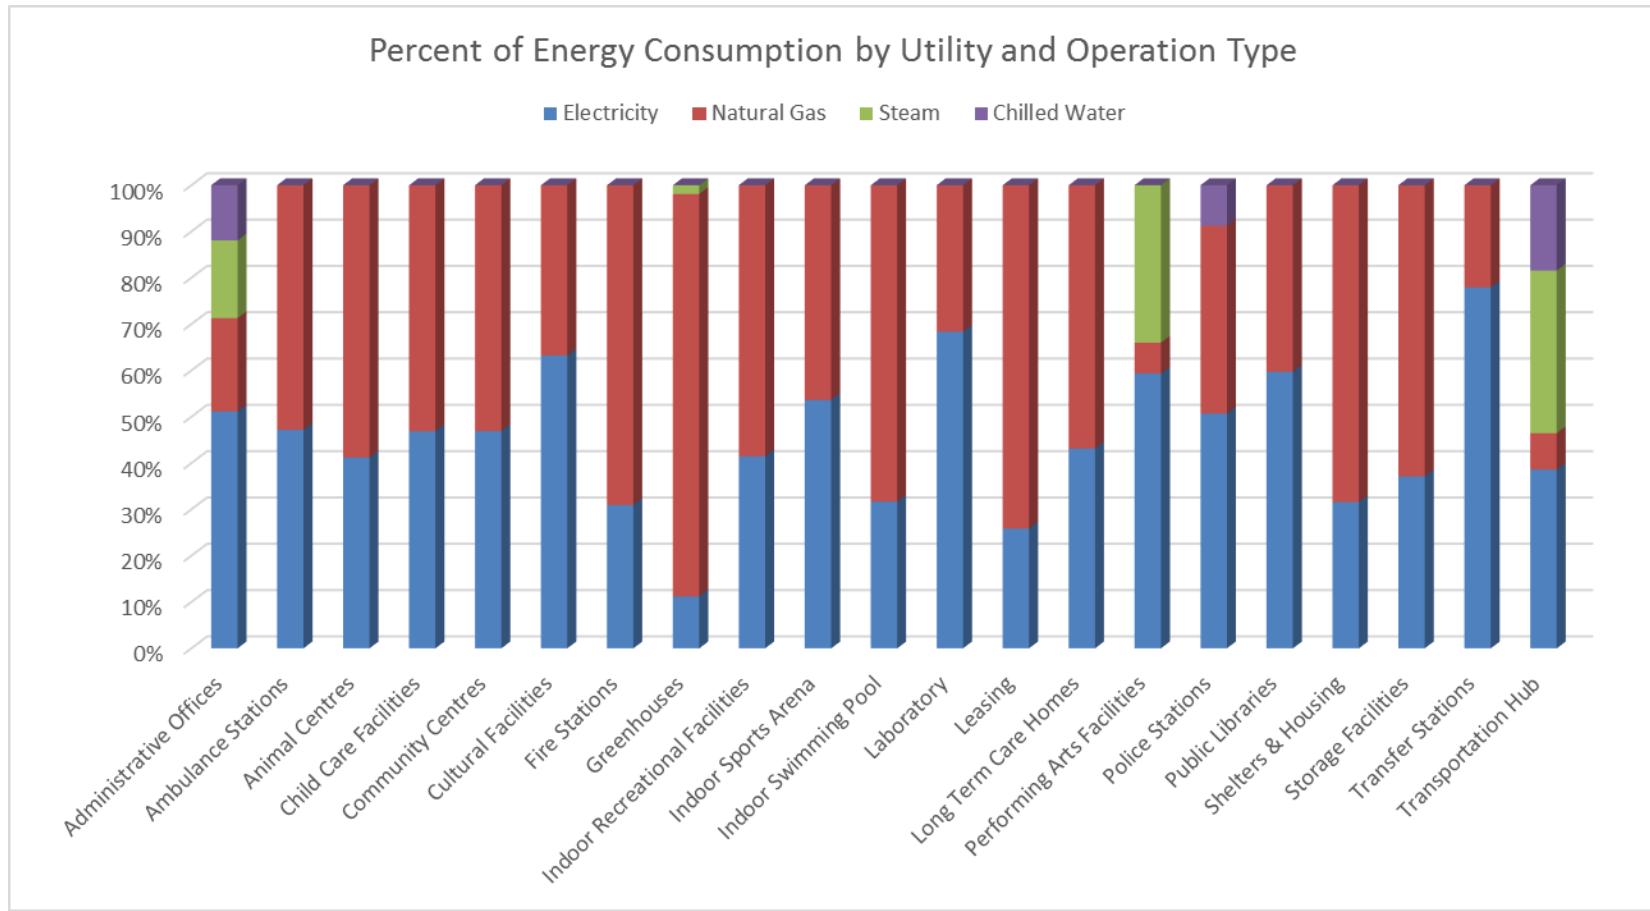

The following figures illustrate energy consumption and composition from various City buildings. Depending on the operations of a certain building the composition of energy usage will change, sometimes drastically.

With over 20 million square feet of floor space, City buildings require significant amounts of energy to operate. Figure 2 illustrates the total energy consumption by building type. Of the reported building types, administrative buildings used the most energy. These building types account for more than 4,000,000 square feet of space, nearly double that of the next highest energy user, police stations. Although leasing accounts for the lowest energy usage, there are some sites for which the City does not have energy data.

Figure 3 details the energy composition of City buildings. Administrative offices have a standard composition of 60% electricity and cooling energy and 40% heating energy. Greenhouses, on the other hand, have a very different composition; with 10% electricity and 90% heating energy, greenhouses use very little lighting, but need large amounts of heat to maintain temperatures during the winter months.

**Figure 2: Building Energy Consumption by Operation Type**

**Figure 3: Building Energy Consumption by Operation Type**

## 5.2 Building Energy Intensity & Analysis

It is important, when comparing buildings, to account for differences in floor area.

Figure 4 compares operation types through energy use intensity, which is the total energy consumption per square foot of floor space. Energy intensity is used for benchmarking energy use performance and can help justify the need for a closer look at conservation opportunities.

Although administrative offices are the highest energy consumer in Figure 2, they are one of the lowest operations in energy intensity. Comparatively, the laboratory had the second lowest energy consumption, but the highest energy intensity.

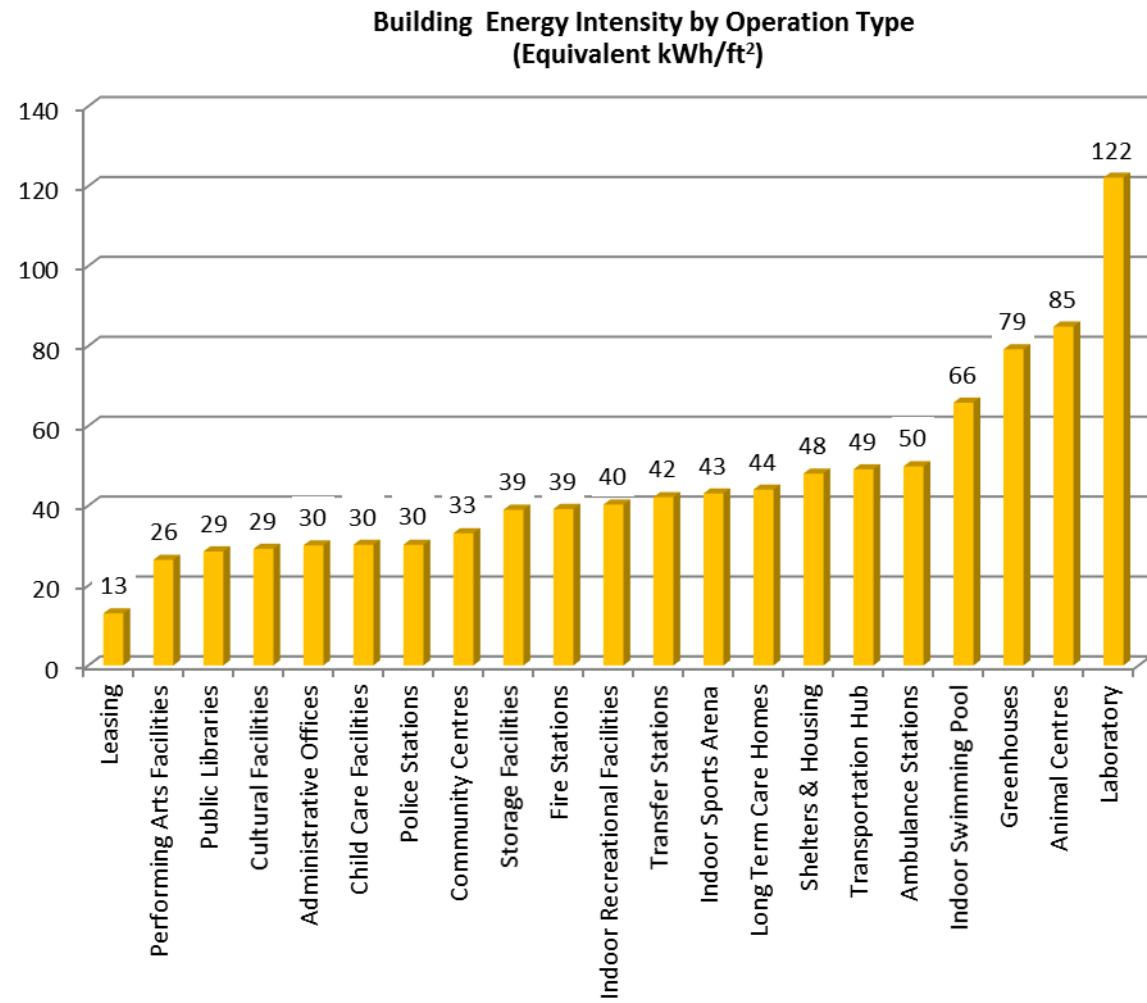

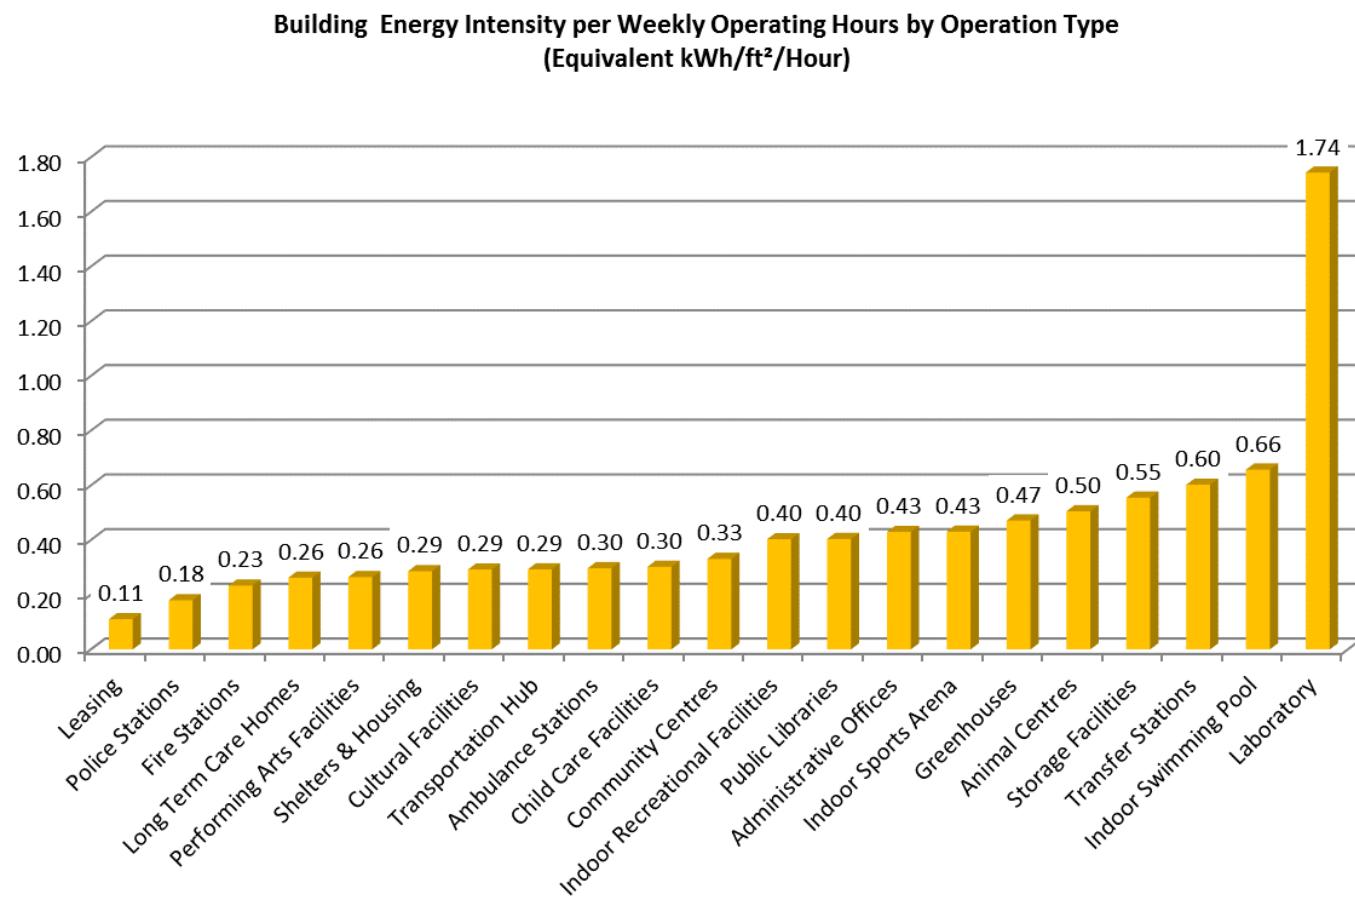

Figure 4: Building Energy Intensity per Operation Type

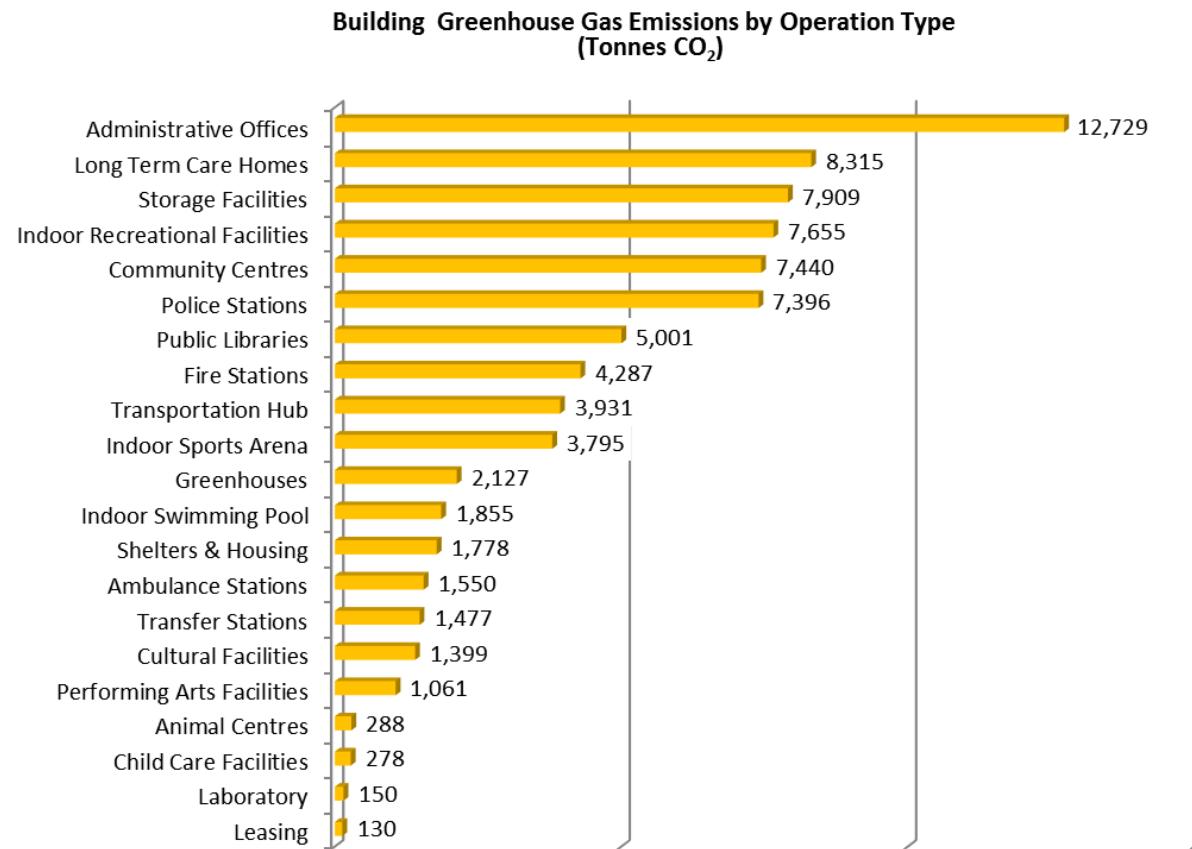

Energy intensity analysis can be taken further by accounting for operating hours. Some locations, such as police stations or ambulance stations run 24 hours a day and may result in a higher energy consumption and energy per square foot. Figure 5 illustrates the energy intensity, accounting for average weekly operating hours.

**Figure 5: Average Building Energy Intensity per Weekly Operating Hours**

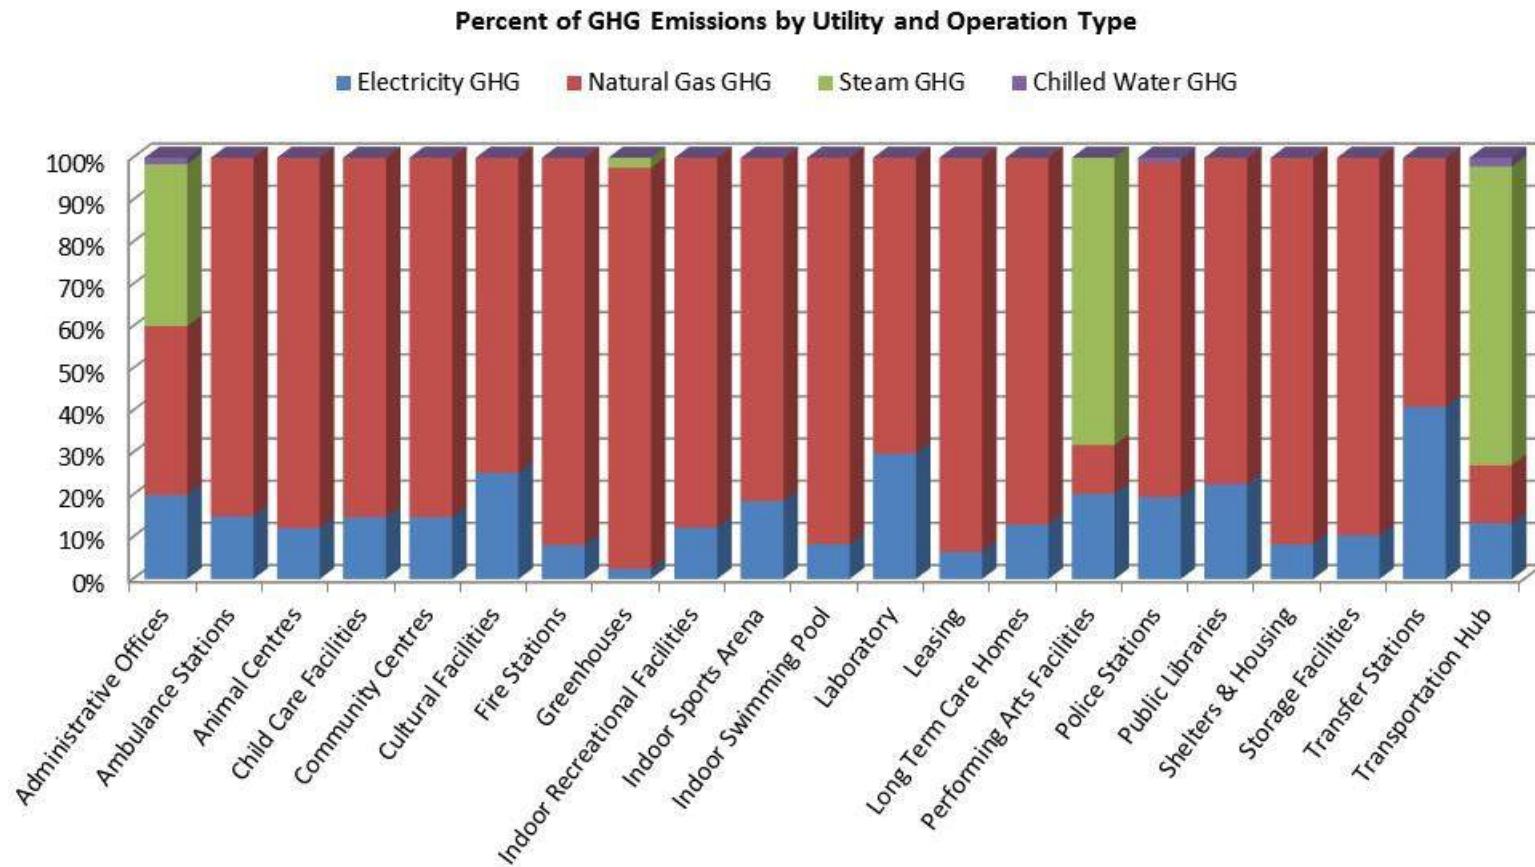

### **5.3 Building Greenhouse Gas (GHG) Emissions**

Over half of greenhouse gas emissions in Toronto come from residential and commercial buildings, primarily due to space and water heating with natural gas. As stated in the TransformTO report, Toronto City Council recognized the far reaching impacts of climate change and unanimously made a commitment to see community-wide greenhouse gas emissions reduced by 80% against 1990 levels by the year 2050. Figure 6 details the total greenhouse gas emissions by building operation type. Although similar in total energy consumption, long term care homes and community centres surpass police stations in GHG emissions. This is due to the extensive heating requirements in these buildings.

**Figure 6: Greenhouse Gas Emissions by Operation Type**

Figure 7 shows the distribution of greenhouse gas emissions by utility for each operation type. Steam has the highest greenhouse gas emissions output of the four utilities. This is due to the use of oil and diesel during periods of extreme cold. Oil and diesel emit more greenhouse gases, per unit of energy, than natural gas.

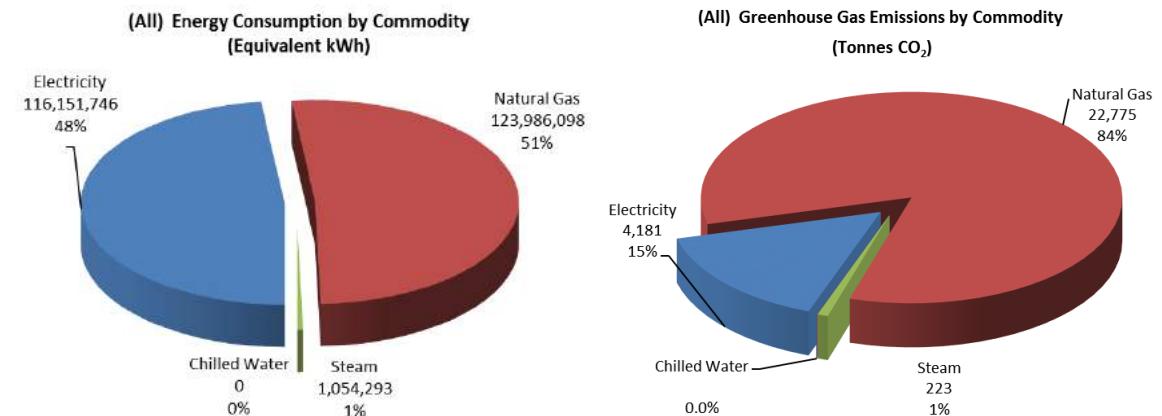

**Figure 7: Building Greenhouse Gas Distribution by Operation Type**

## 5.4 Large Energy Consumers

### 5.4.1 Parks, Forestry & Recreation

Parks, Forestry & Recreation (PFR) accounts for 623 locations, or 42% of all reported facilities. This is due to the large number of recreation areas, such as parks, outdoor pools, ball diamonds, and other outdoor locations. PFR locations also account for a large portion of total energy consumption and GHG emissions.

	Total ekWh	Total GHG
Division Operations	243,770,820	27,180
All Operations	2,131,761,096	165,003
<b>Division % of Total</b>	<b>11.44%</b>	<b>16.47%</b>

### 5.4.2 Facilities Management

There are 105 operations included in Facilities Management, including civic centres, police stations, leased buildings, communication towers and Union Station. These locations account for less than 10% of total reported locations, but are comparable in energy consumption and greenhouse gas emissions to the PFR locations. Facilities Management contains larger locations, has no seasonal operations, and police facilities are operated 24 hours a day.

	Total ekWh	Total GHG
Division Operations	256,535,065	24,190
All Operations	2,131,761,096	165,003
<b>Division % of Total</b>	<b>12.03%</b>	<b>14.66%</b>

## 6 Process Energy and Greenhouse Gas Emissions Analysis

Process-based operations include streetlighting, water pumping and treatment, outdoor recreation facilities, among others. Figure 8 shows that electricity is, by far, the most used commodity in process-based operations. However, when looking at greenhouse gas (GHG) emissions, natural gas makes up nearly 50% of total GHG emissions in process-based operations.

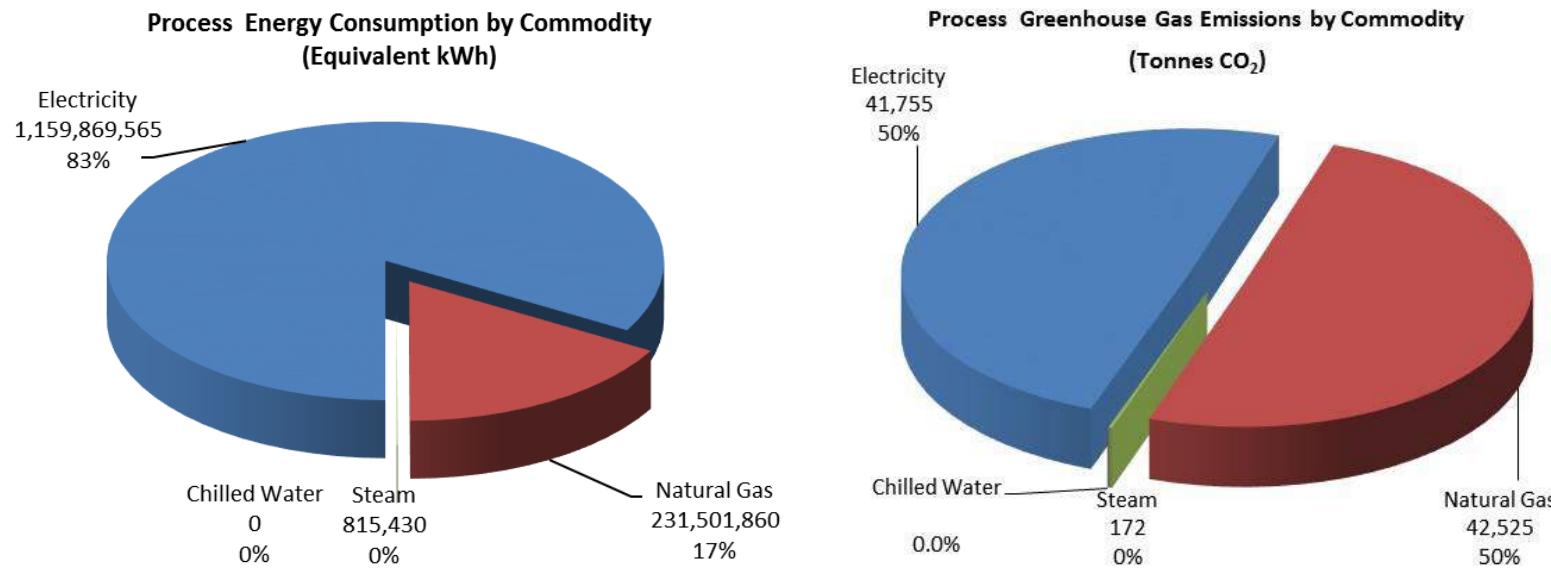

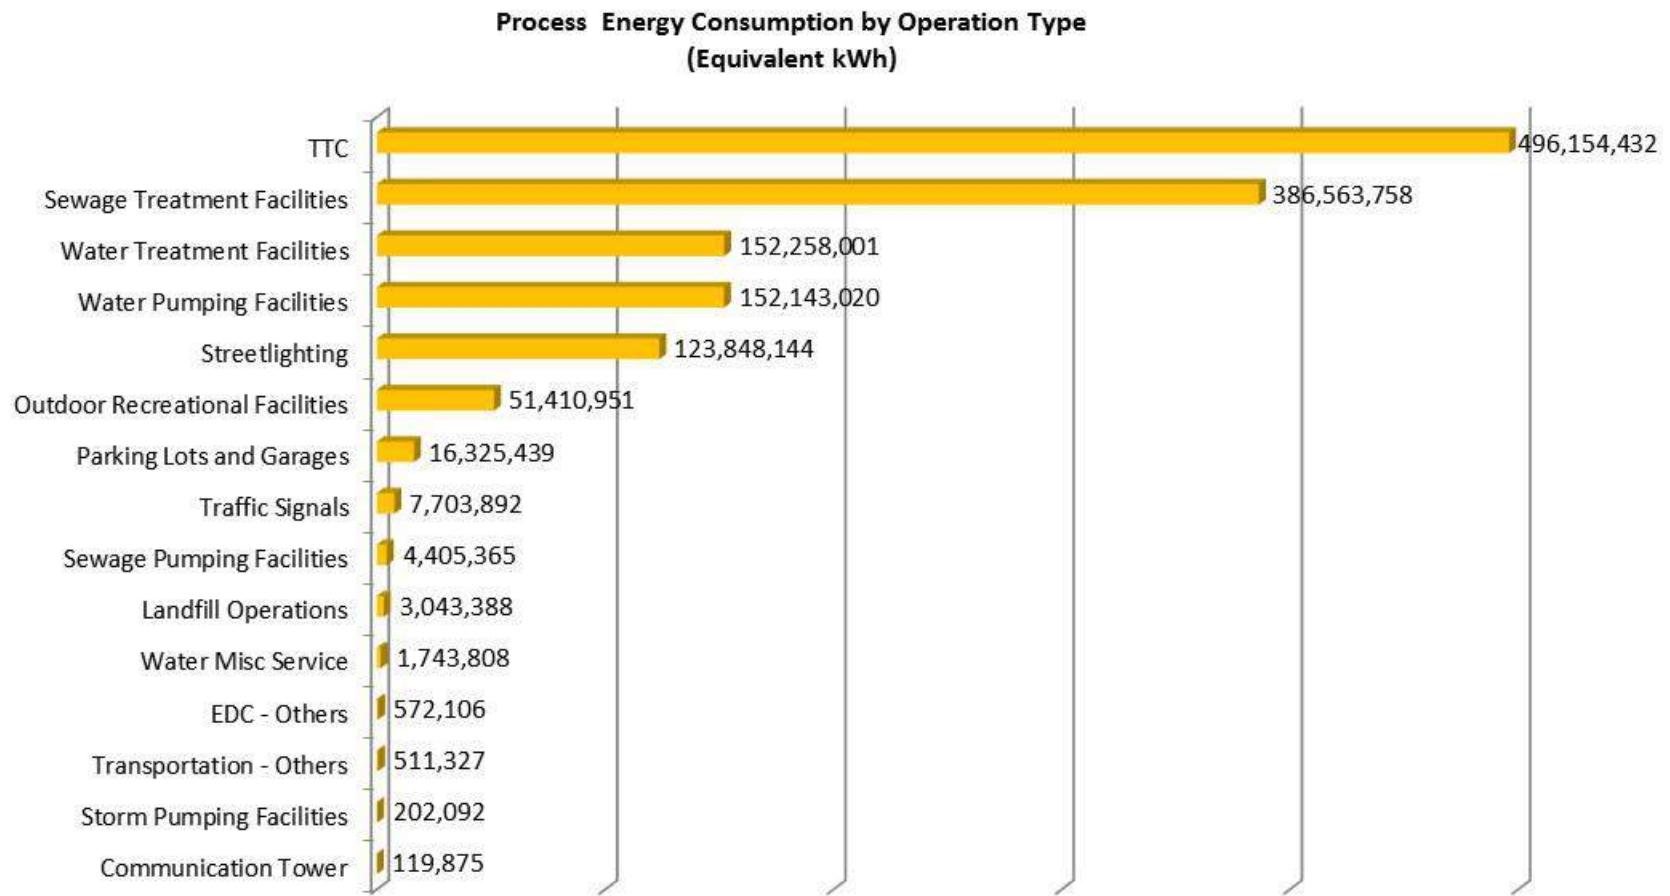

Figure 8: Process Energy Consumption and GHG Emissions by Energy Type

### 6.1 Process Energy Consumption

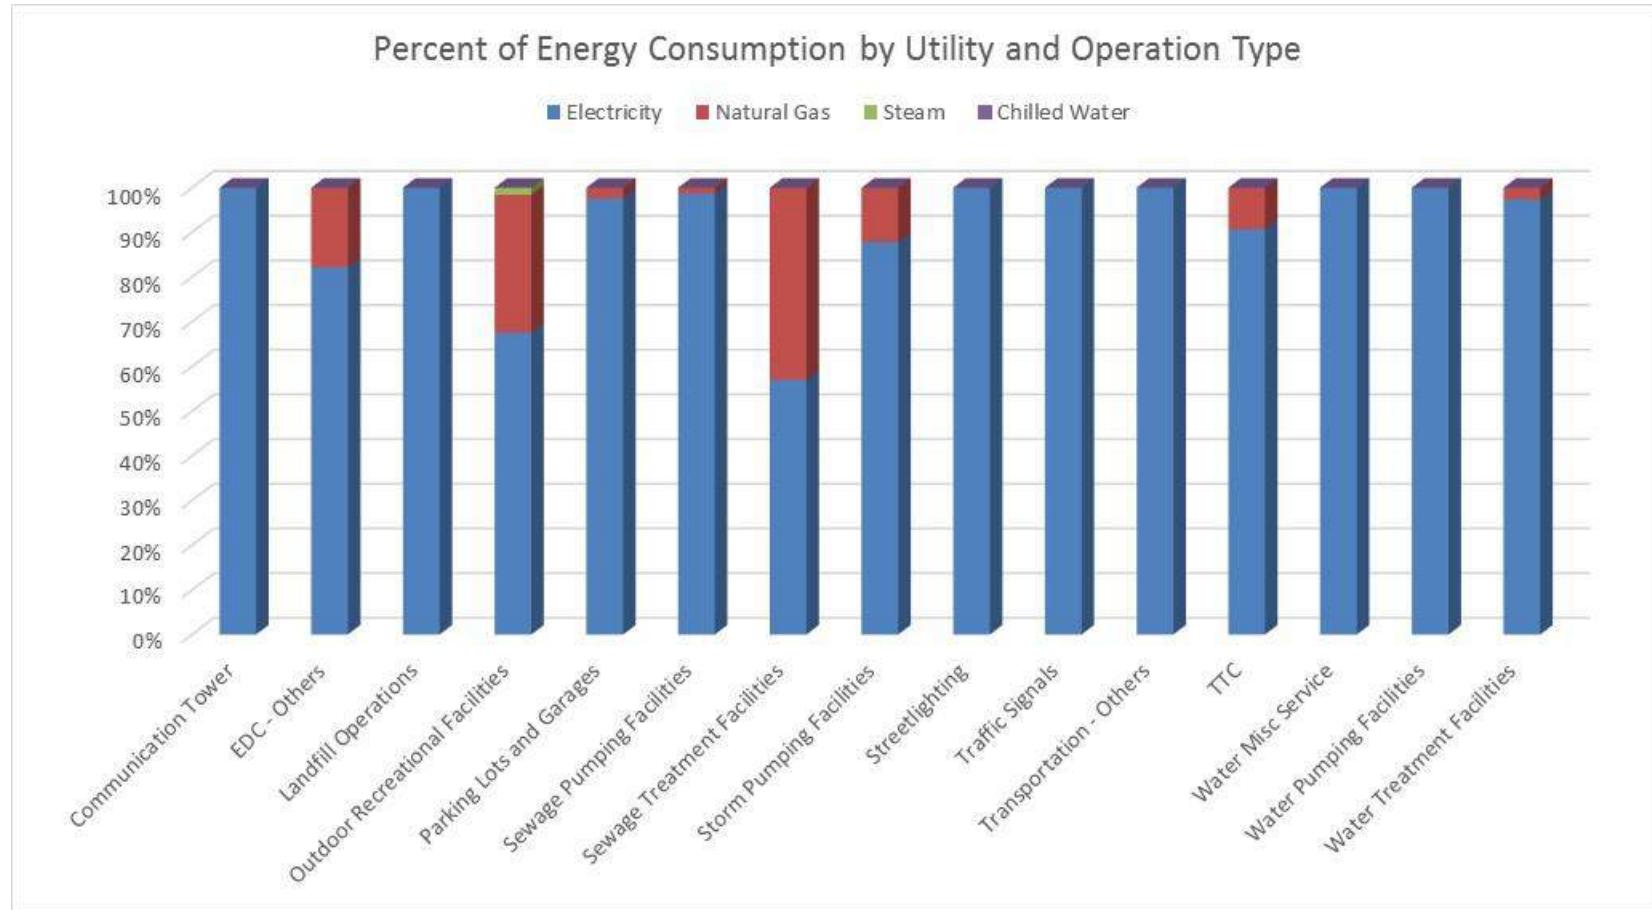

Toronto Transit Commission, sewage treatment plants, water pumping, and water treatment plants consume the most amount of energy among City processes. This is mainly due to their continuous operation, energy intensive equipment, and regulatory requirements around water treatment. A large amount of electricity is used to pump fresh water uphill in order to service businesses and residents in the north

end of the City. Figure 9 details total energy consumption by process-based operation types. Sewage treatment plants require energy intensive equipment to treat wastewater and meet regulatory compliance related to effluent and odour control.

**Figure 9: Process Energy Consumption by Operation Type**

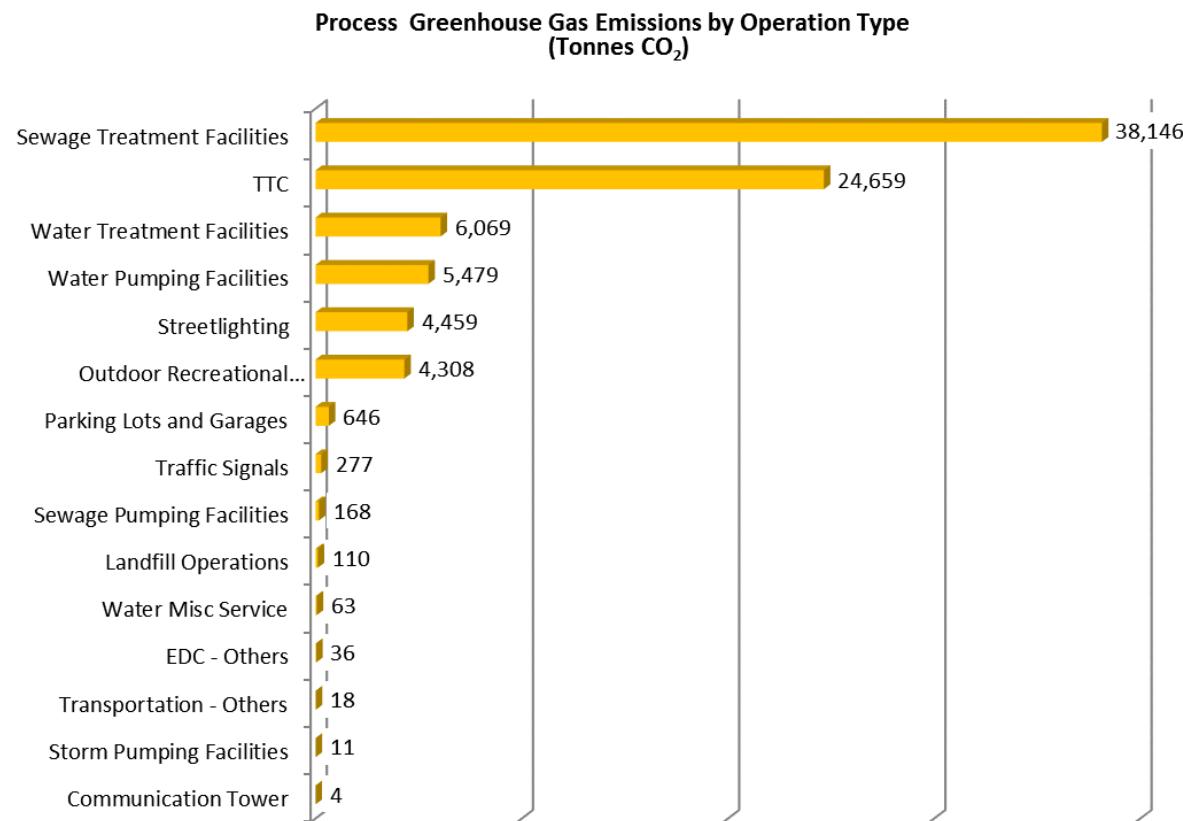

Figure 10 illustrates the percentage of energy from each utility by operation type. Some operations use far more of one utility due to their unique operations. Outdoor recreational facilities use natural gas for outdoor pool and change room/washroom heating. Electricity is the primary energy source for process-based operations.

**Figure 10: Process Energy Consumption by Utility and Operation Type**

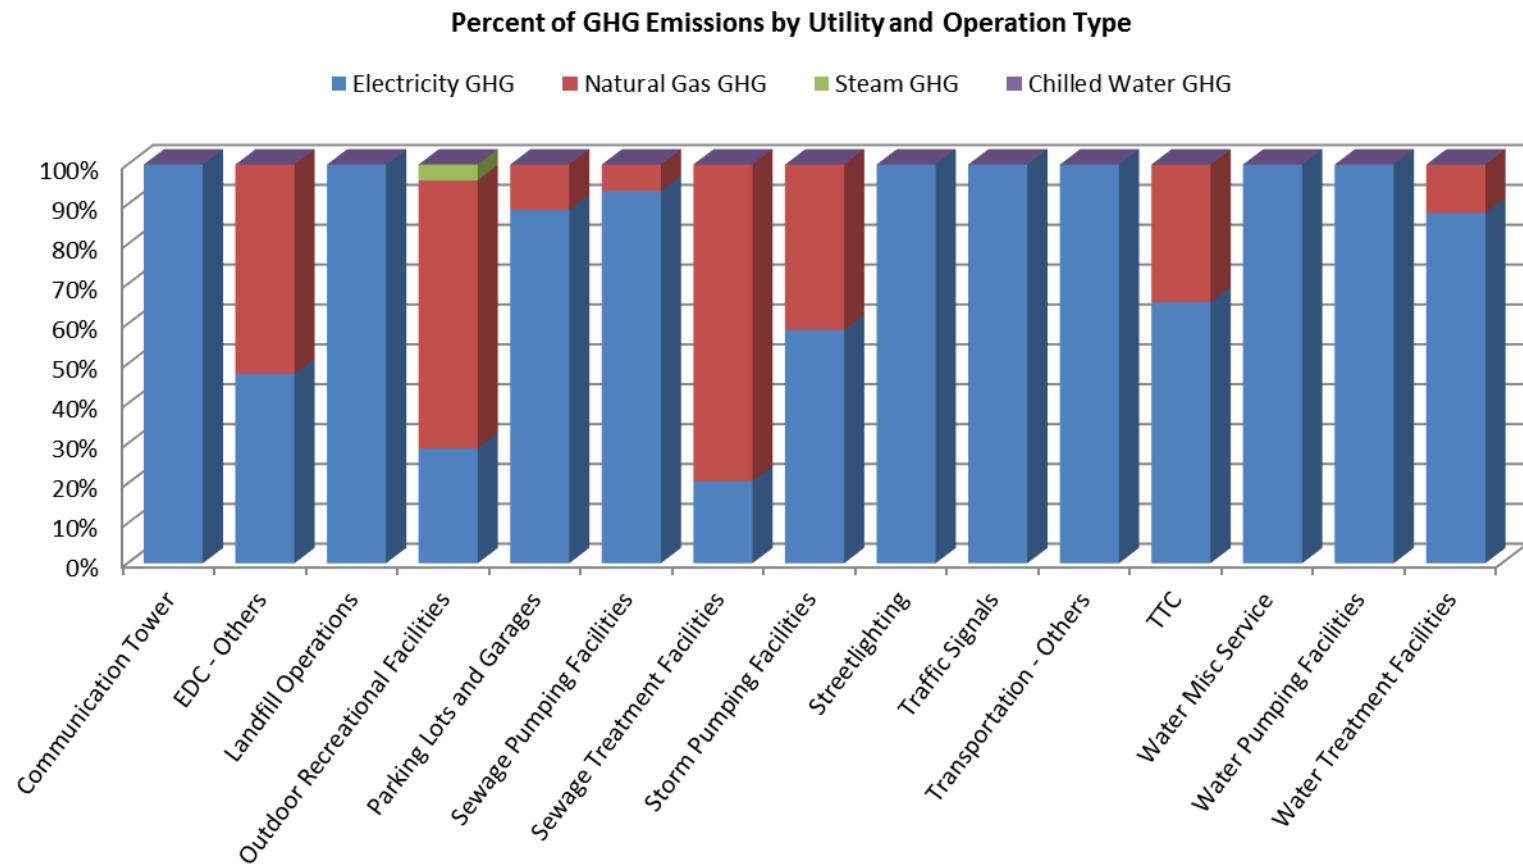

## 6.2 Process Greenhouse Gas Emissions

As with City buildings, process-based operations also produce greenhouse gas emissions through energy consumption. Figure 11 details the total tonnes of CO<sub>2</sub> produced through process-based operations. Sewage treatment facilities top the list as they use more energy and also use natural gas in some processes. The TTC is second due to the large amount of electricity necessary to operate subways and streetcars.

**Figure 11: Process-Based Greenhouse Gas Emissions by Operation Type**

Figure 12 illustrates the proportion of greenhouse gas emissions attributed to each commodity type and by each process-based operation.

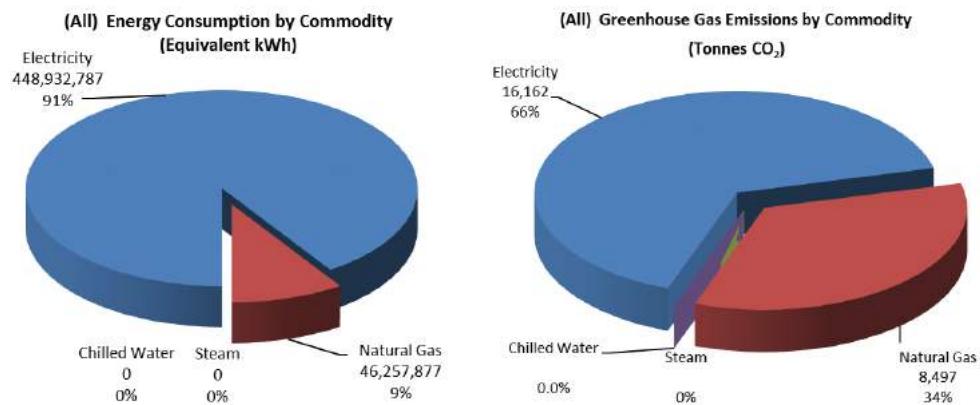

**Figure 12: Process-Based Greenhouse Gas Distribution by Operation Type**

## 6.3 Large Energy Consumers – Process Energy

### 6.3.1 Toronto Transit Commission

Toronto Transit Commission includes 140 locations, made up of subway stations, garages, and substations that are used to run the extensive subway and streetcar network.

	Total ekWh	Total GHG
TTC Operations	496,154,432	24,659
All Operations	2,131,761,096	165,003
<b>Division % of Total</b>	<b>23.27%</b>	<b>14.94%</b>

### 6.3.2 Toronto Water

There are 96 operations included in Toronto Water, including water/wastewater pumping and treatment facilities, storm water pumping, and a laboratory. These locations account for less than 10% of total reported locations, but use the most in energy consumption and greenhouse gas emissions. Toronto Water contains operations that are operated 24 hours a day and must meet stringent regulatory requirements.

	Total ekWh	Total GHG
Division Operations	699,146,472	50,086
All Operations	2,131,761,096	165,003
<b>Division % of Total</b>	<b>32.80%</b>	<b>30.35%</b>

#### **6.4 Energy Intensity for Water Treatment and Pumping Facilities**

The primary focus of water treatment facilities is to ensure that Lake Ontario water is drinkable by residents and businesses in Toronto. This energy-intensive process produces more than 1 billion litres of potable water every day, exceeding Federal and Provincial water quality standards. Through a series of filtration methods, chemical balancing, and testing, treated water is then delivered to homes and businesses through a complex pumping system.

The water pumping infrastructure distributes potable water from treatment plants and throughout the City. Since water treatment plants are located near Lake Ontario, water pumping involves moving water uphill towards the north-end of the City. Pumping uphill uses more energy and requires high-level pumps.

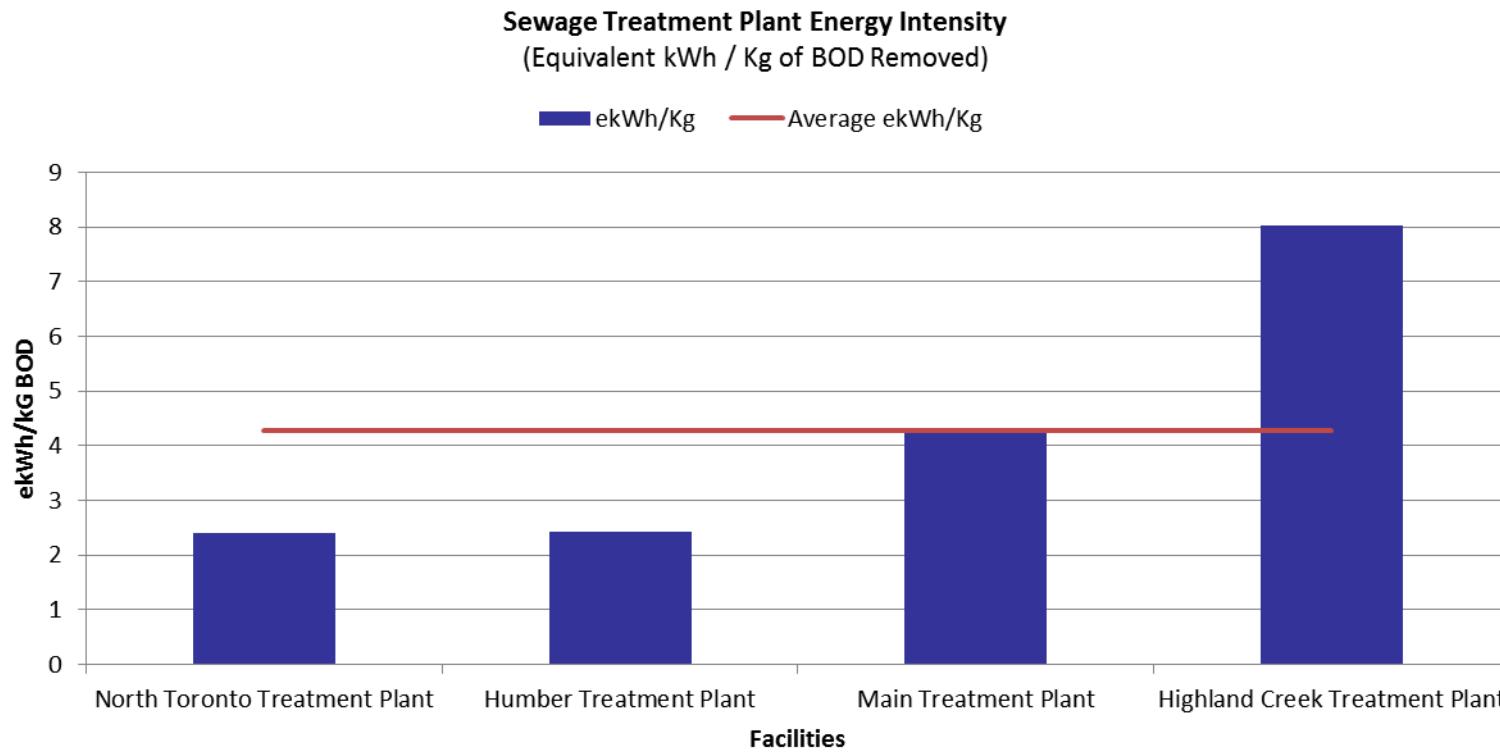

In contrast, sewage pumping facilities move sewage to sewage treatment plants. Since most sewage is flowing downhill, gravity assists with this process, reducing the amount of pumping energy required. Thus, sewage pumping is less energy intensive than potable water pumping.

In order to comply with the legislative requirements of the Green Energy Act, these buildings have been reported to the Ontario Ministry of Energy using equivalent kilowatt-hours per megalitres (ekWh/ML) of water that flowed through the plants. The corresponding graph and table are included in Appendix 'C'.

## **6.5 Energy Intensity for Sewage Treatment Facilities**

Sewage treatment facilities are a unique process-based operation type and thus require a unique approach in energy management. The focus of these facilities is to remove solid waste from the sewage, treat the remaining water and release the treated water back to the environment. Because the volume of water consumed is influenced by the quantity and type of solid waste, sewage treatment facilities should not be analyzed on the amount of water moving through the plant but by the amount of waste removed. This waste is known as biological oxygen demand (BOD) and is measured in kilograms. Biological oxygen demand refers to the make-up of the waste, which has the ability to deplete oxygen levels in surrounding water.

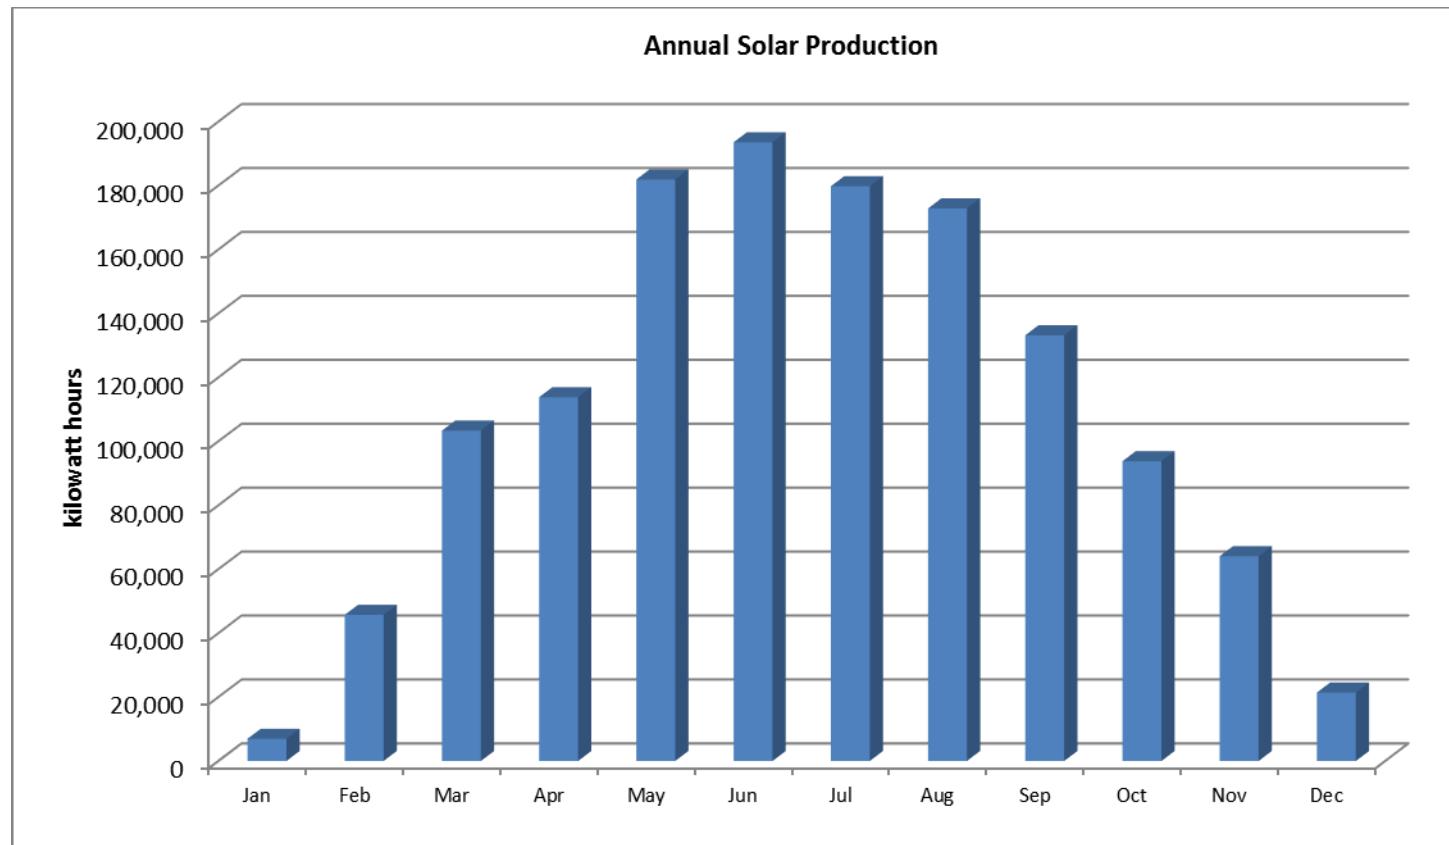

The following graph shows the energy intensity based on Kg of BOD Removed for each of the four sewage treatment plants. In order to comply with the legislative requirements of the Green Energy Act, these buildings have been reported to the Ontario Ministry of Energy using equivalent kilowatt-hours per megalitres (ekWh/ML) of water that flowed through the plants. The corresponding graph and table are included in Appendix 'C'.

**Figure 13: Energy Intensity of Sewage Treatment Plants**

## 7 Solar Energy Production

As of 2017, the City had 94 solar photovoltaic installations under Feed-in-Tariff (FIT) and microFIT contracts with the Independent Electricity System Operator. These systems generate nearly 3.3 million kWh's of clean electricity that is sent directly to the Toronto Hydro electrical grid.

**Figure 14: Total Monthly Solar Production**

## 8 Appendices

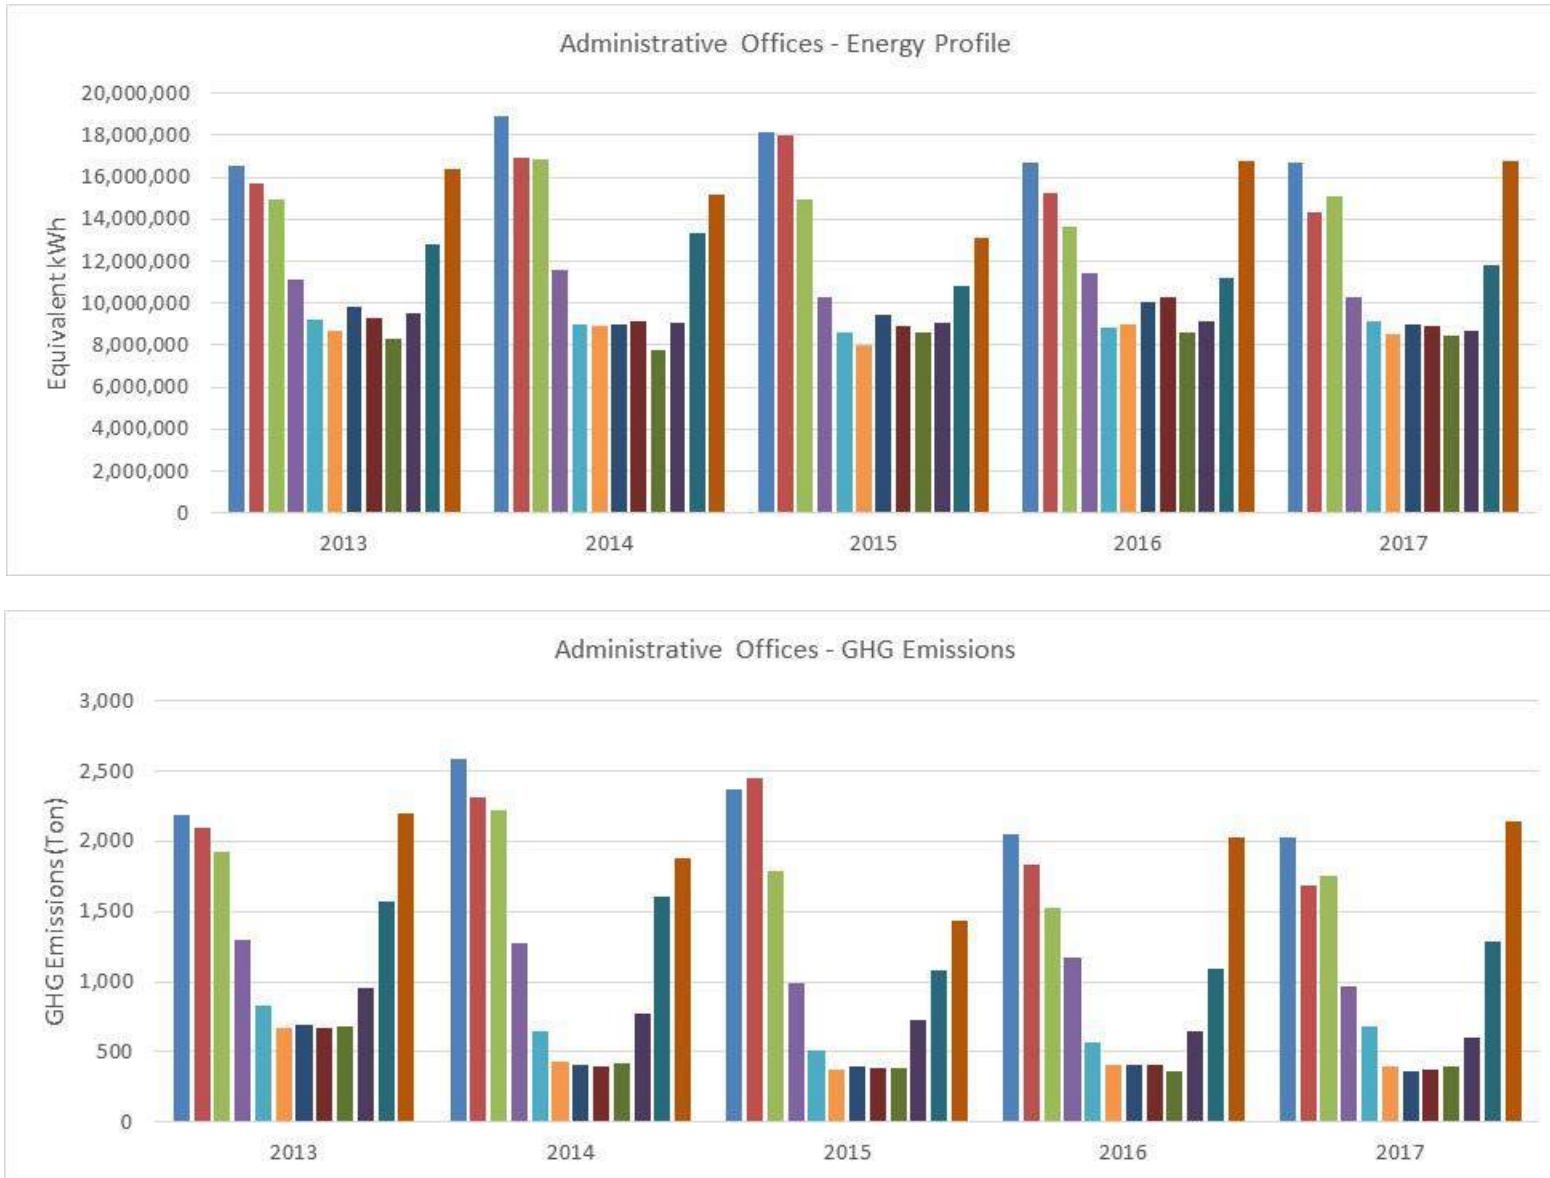

### ***Appendix A - Five Year Review***

This section provides details of monthly variations for the last five years in terms of energy consumption and greenhouse gas emissions. Variations in year-over-year consumption patterns are a result of data collection issues and changes in building operations. The following list details explanations for variations in energy and GHG emission patterns amongst some of the operation types.

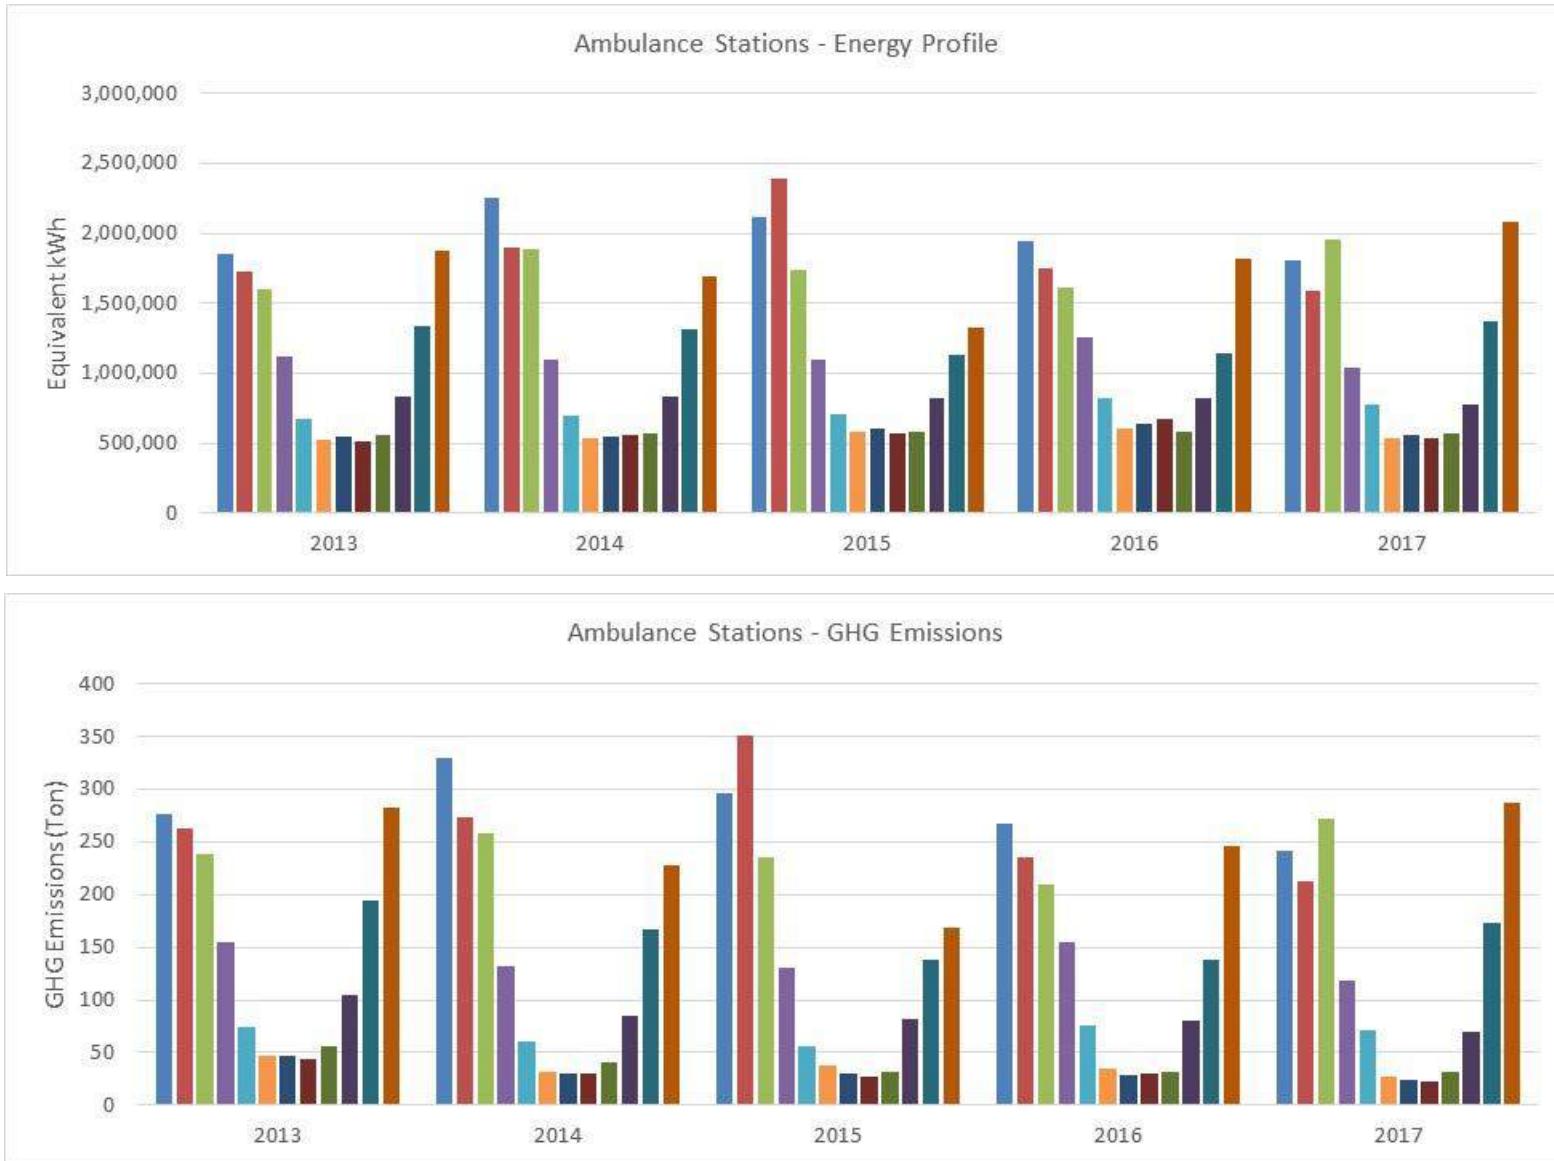

- Economic Development & Culture – Others: City Hall Eternal Flame did not receive consistent data updates by the utility, resulting in sporadic periods of high consumption
- Facility Management – Others: Building was closed in 2014
- Leasing: Improvement in data acquisition for leased locations in 2015/2016
- Sewage Treatment Plants: 2015 saw an increase in natural gas due to maintenance operations that limited biogas use.
- Traffic Signals: Improvement in data acquisition in 2014
- Transportation Hub: Union Station increased energy use following expansion of concourse areas
- Water Miscellaneous Service: Improvement in data acquisition

The following tables and charts detail the monthly energy consumption and greenhouse gas emissions of each operation type between 2013 & 2017.

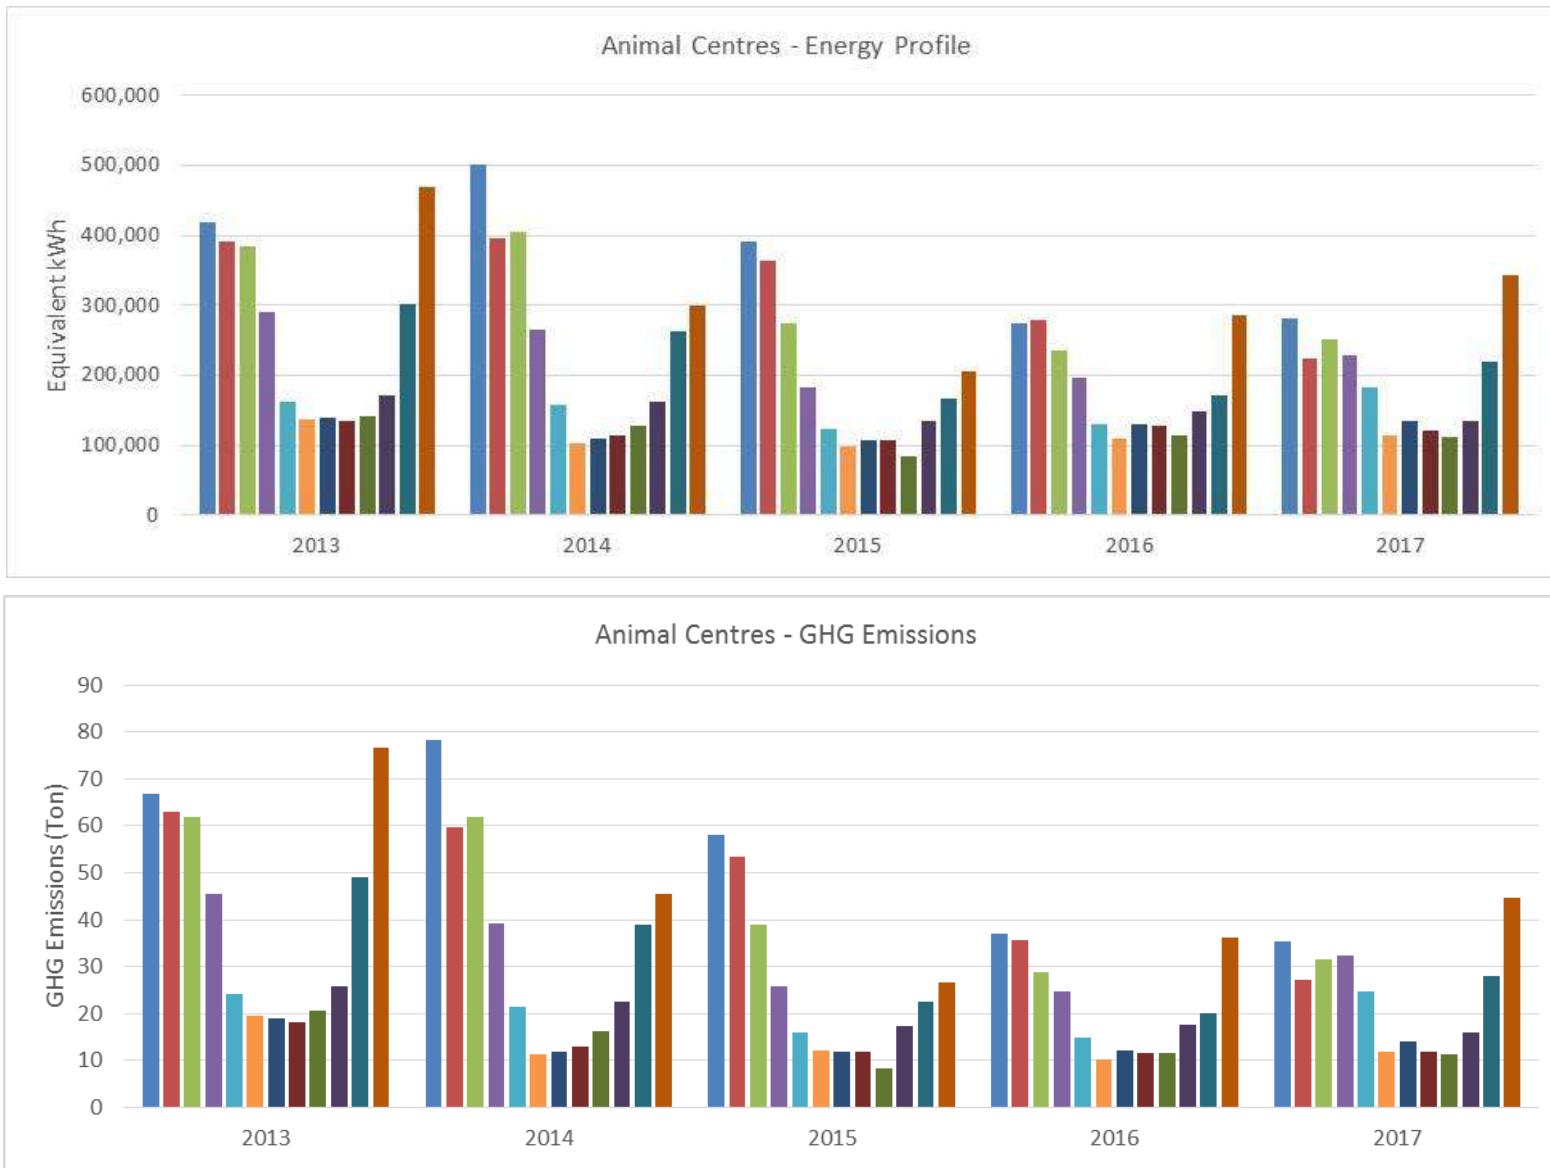

## Administrative Offices

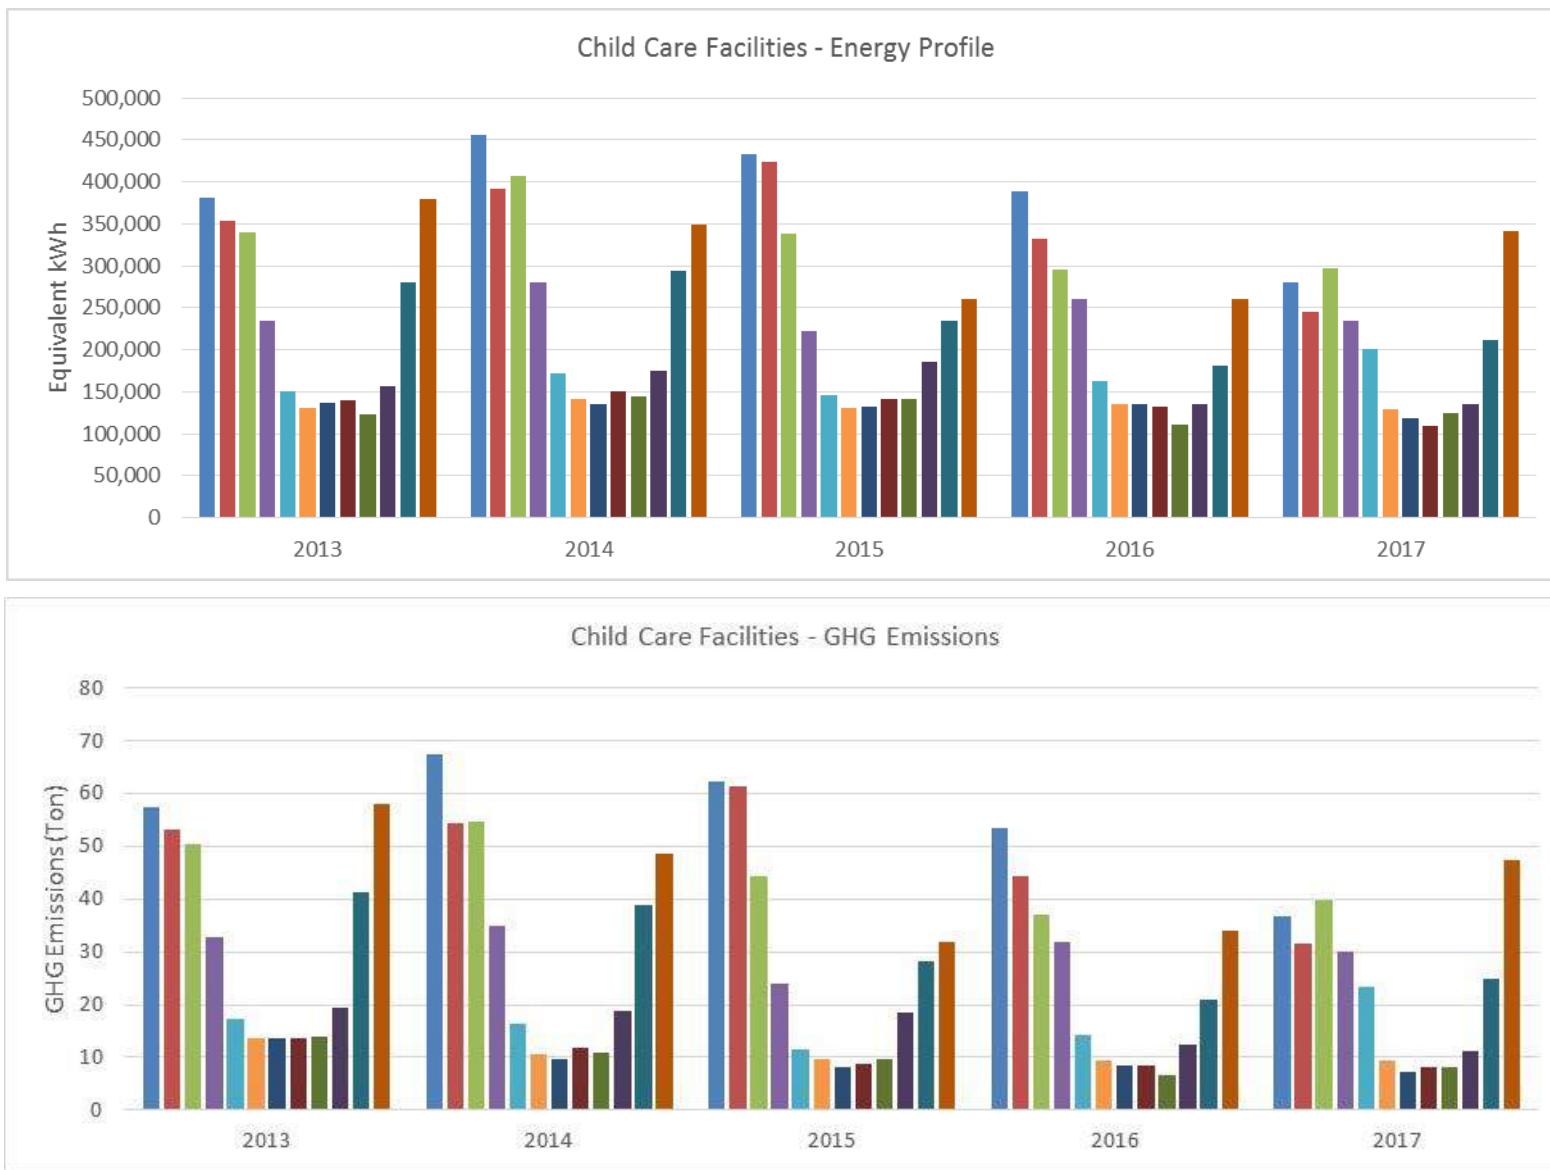

## Ambulance Stations

## Animal Centres

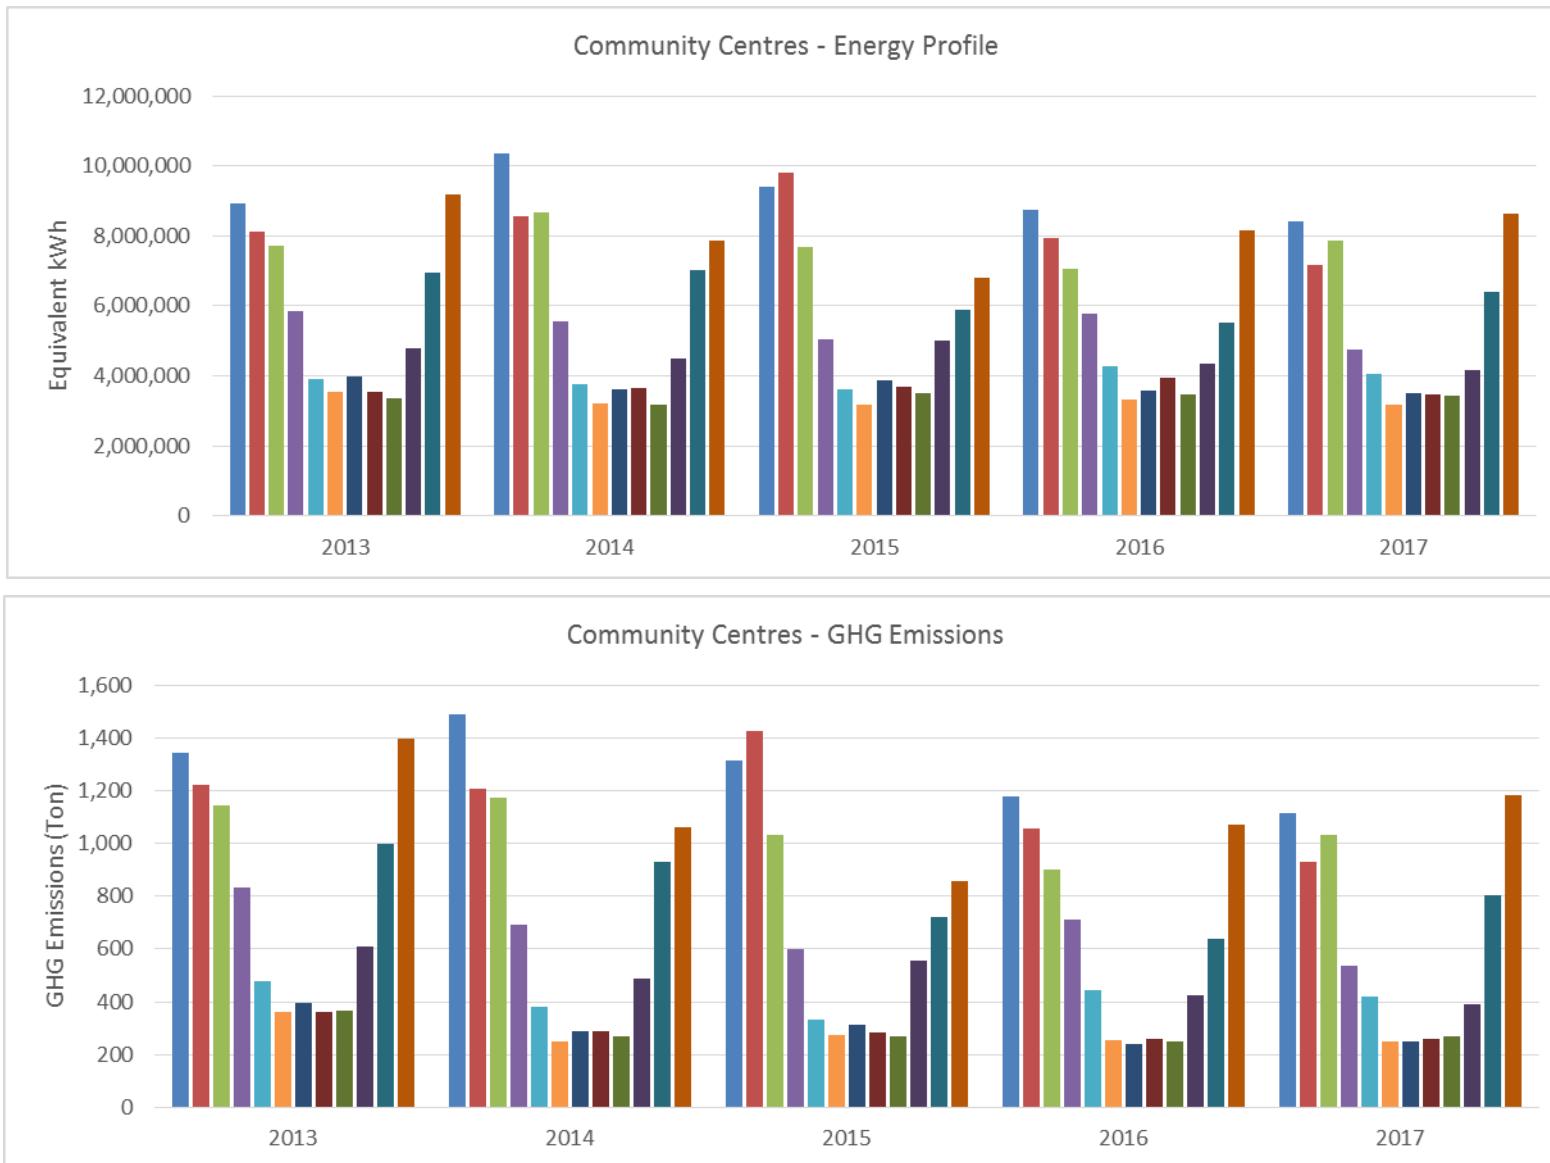

## Child Care Facilities

## Communication Towers

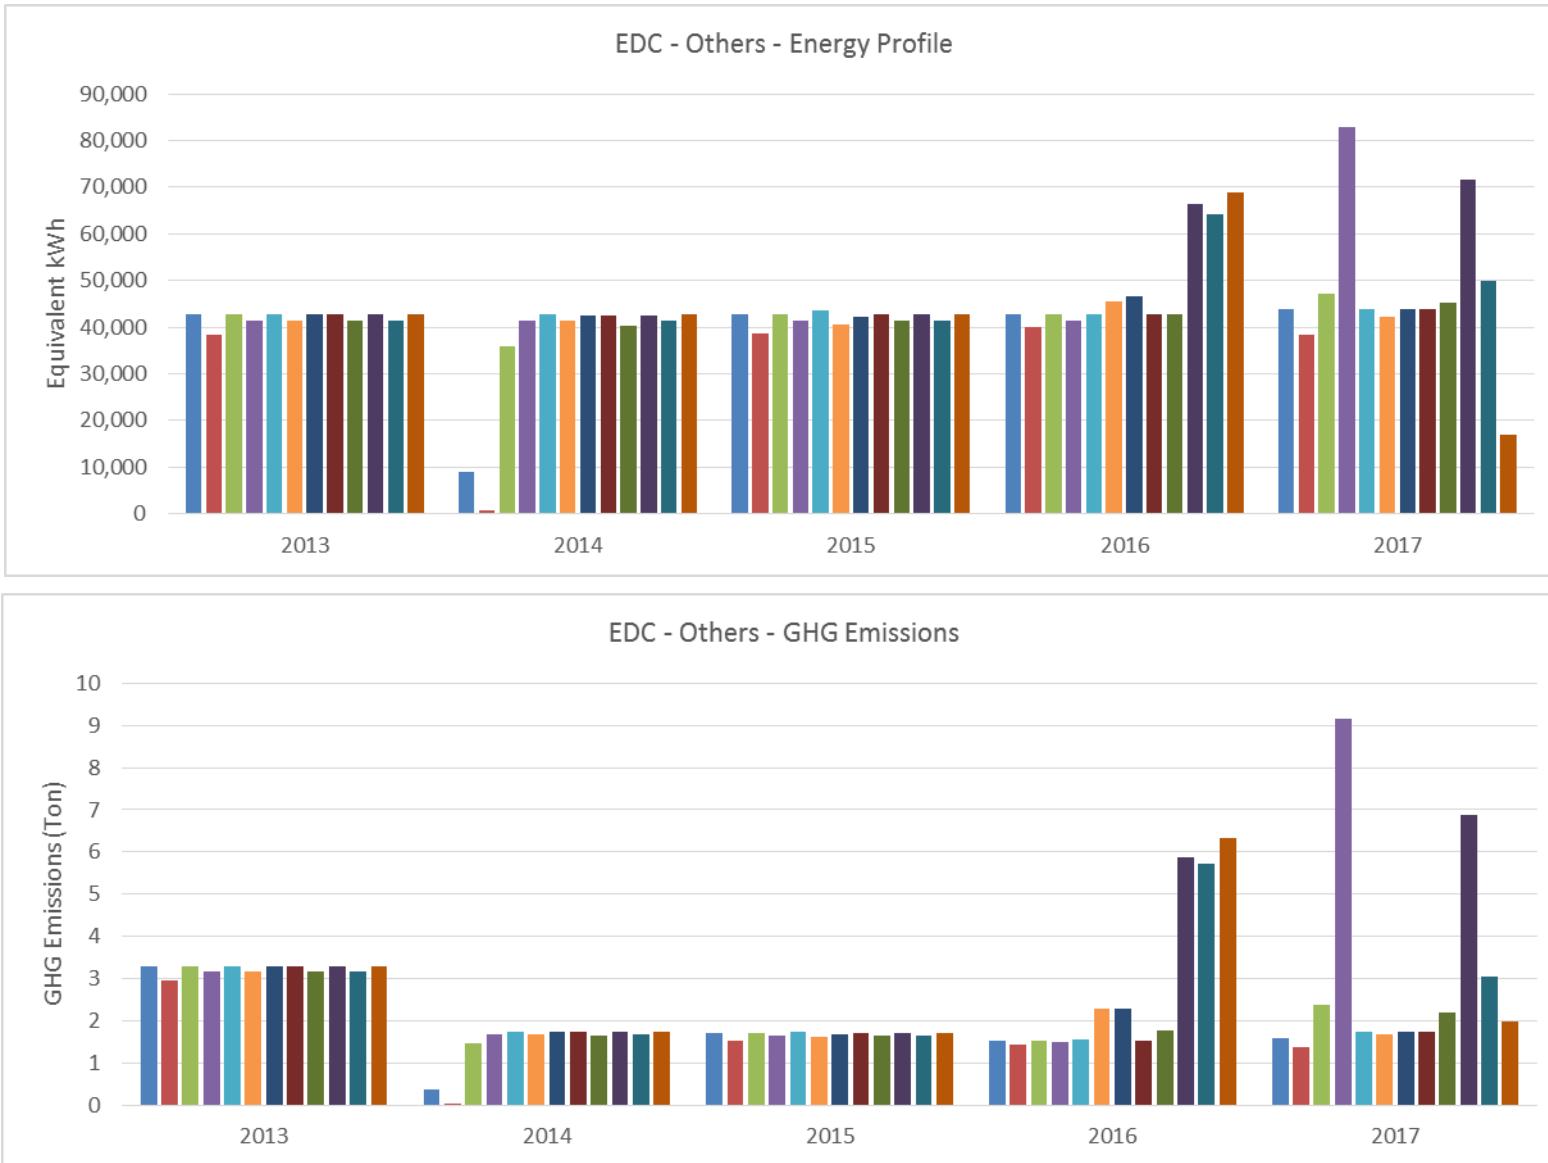

## Community Centres

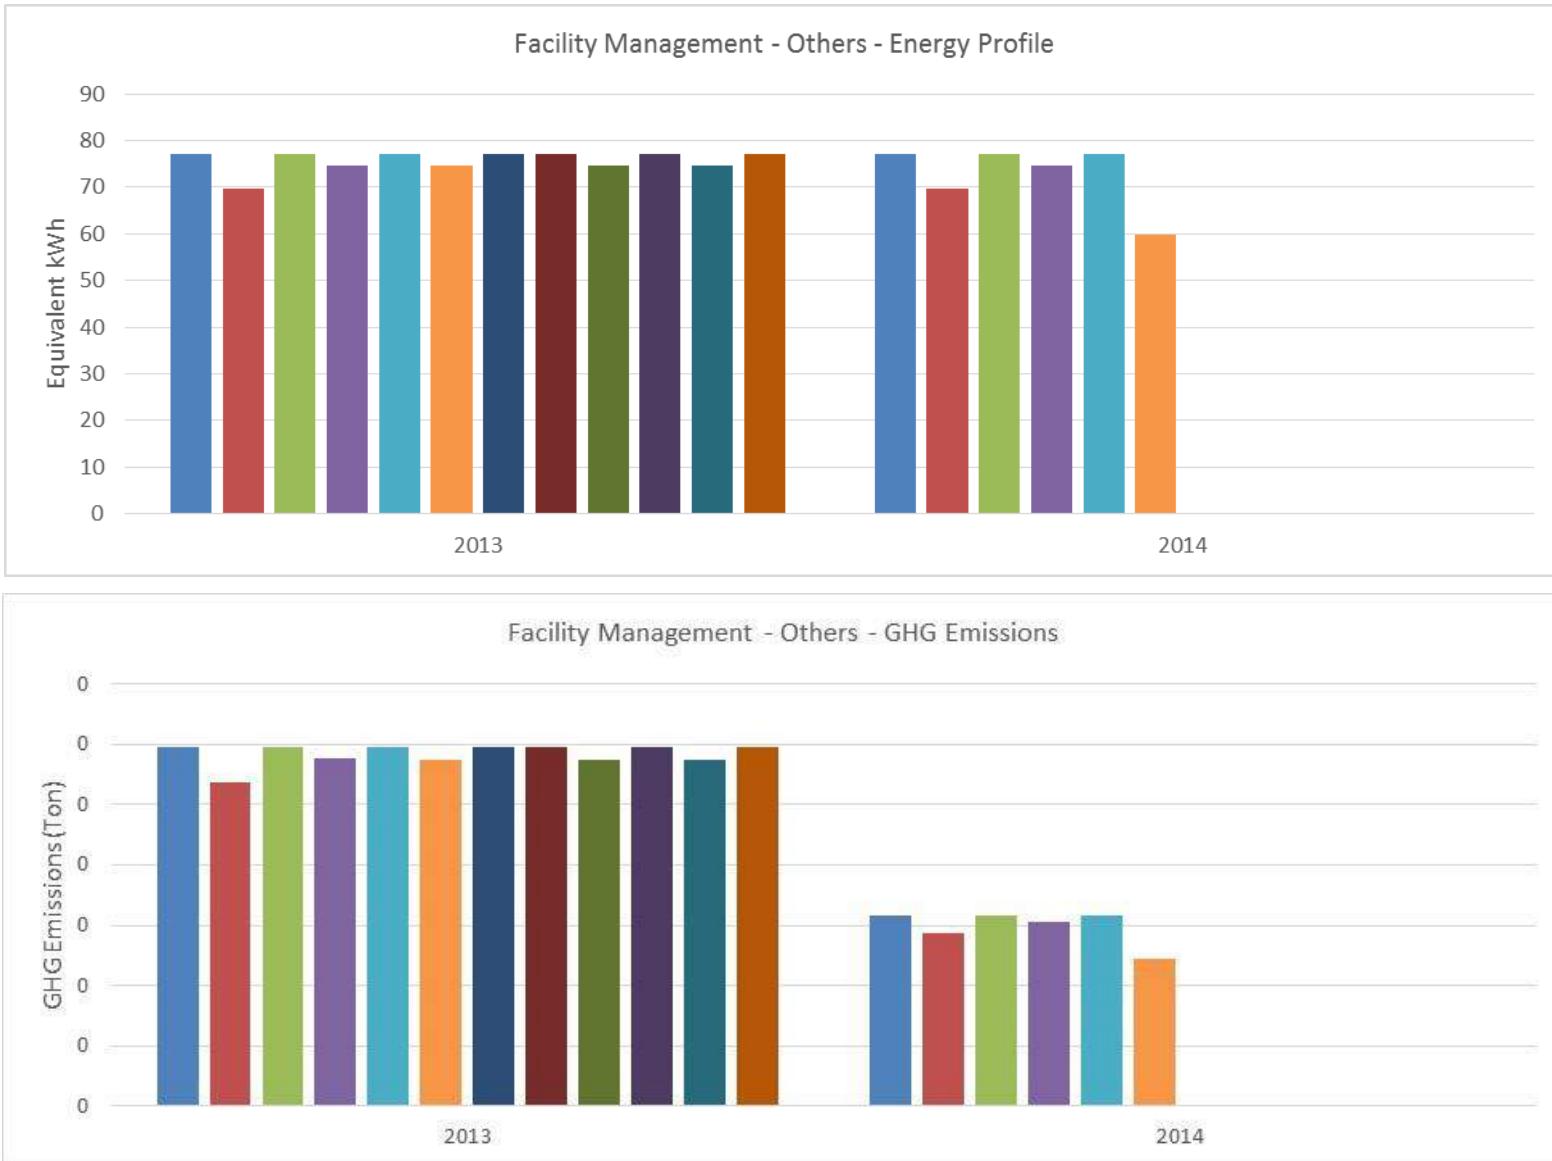

## Cultural Facilities

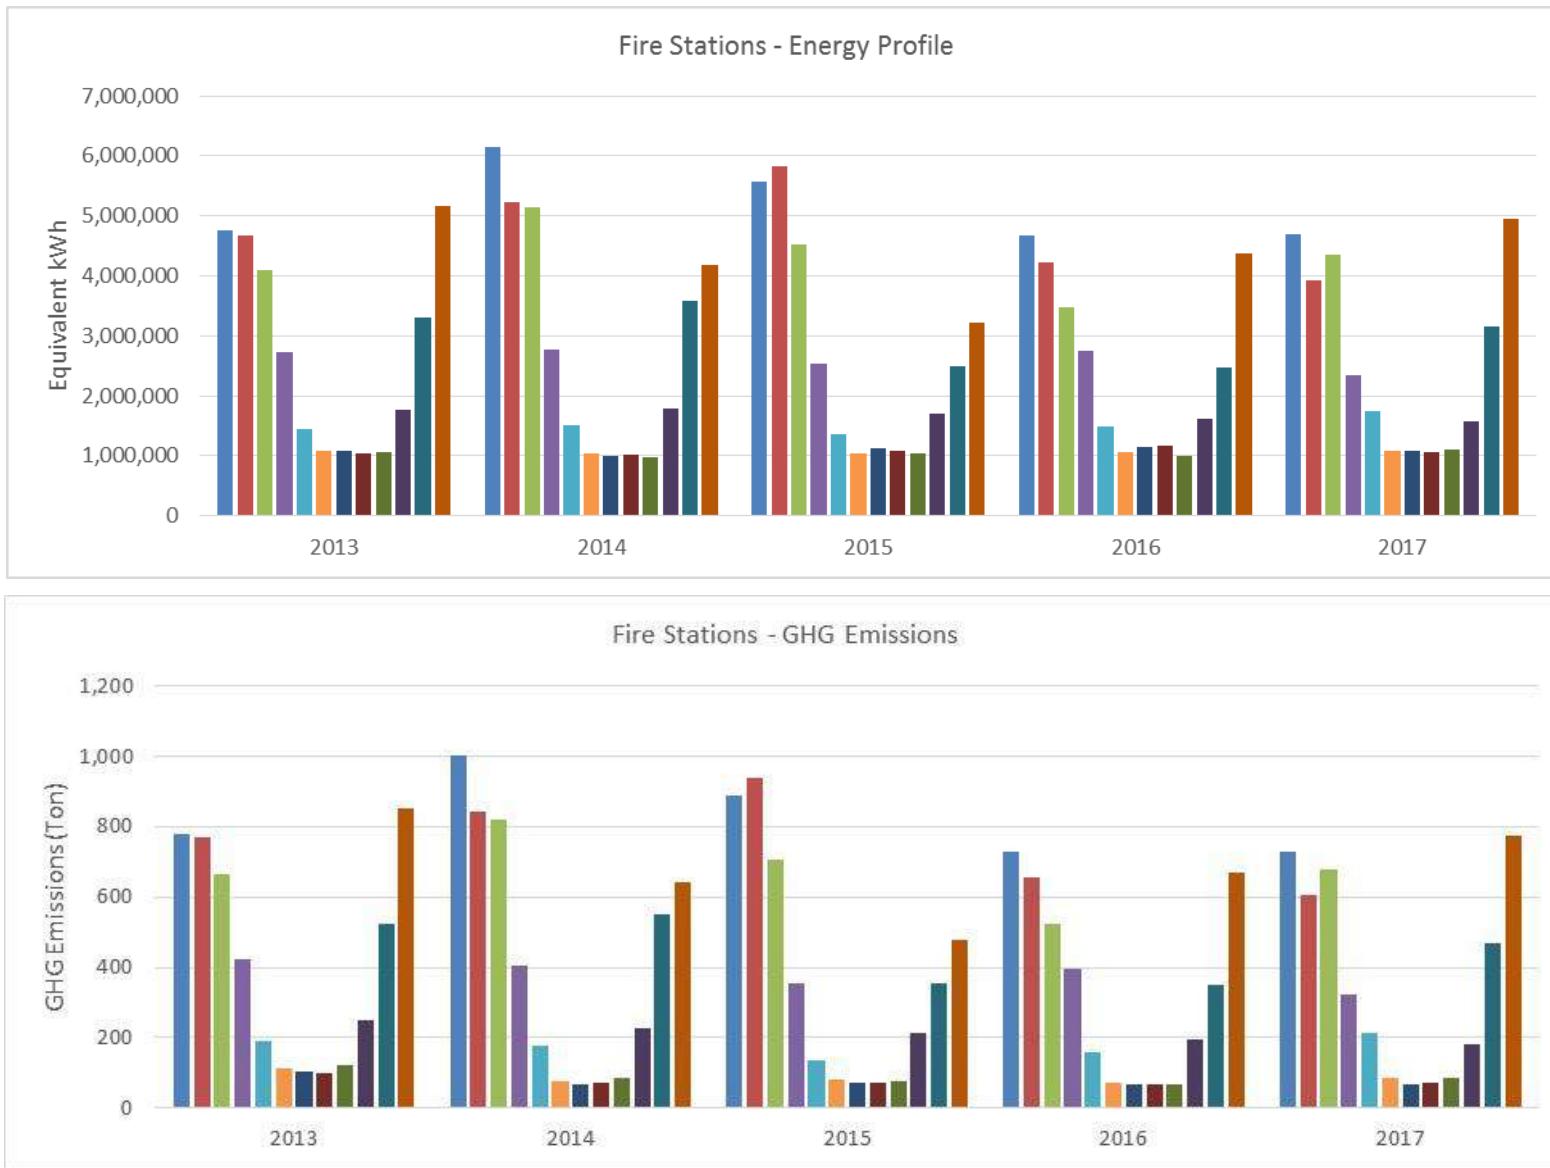

## Economic Development and Culture – Others

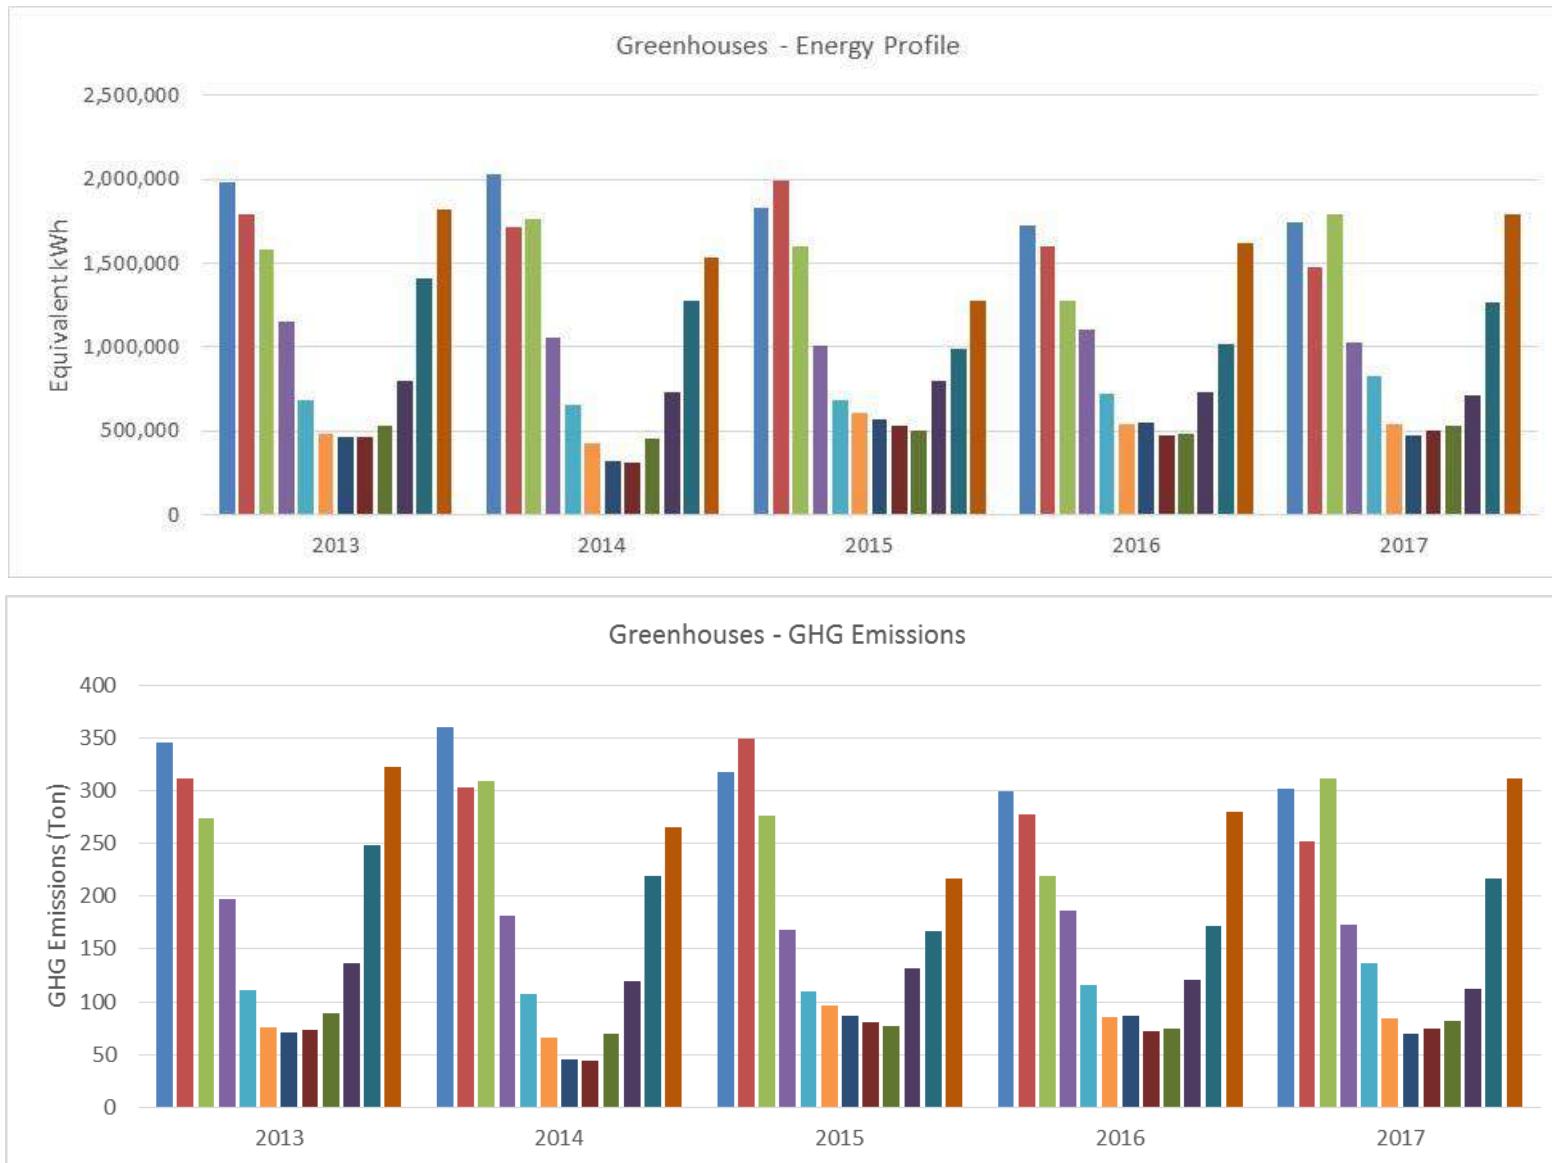

## Facility Management – Others
